

EESI Issue Brief on Government Climate Change Publications

There has been an outpouring of reports from both domestic and international governmental bodies supporting the existence, causes, and need for action concerning climate change. On this website are summaries of a selected number of these publications. Depending on the authoring body, each report has a varying focus, but they all support the common theme that climate change is happening, its causes are anthropogenic, and planning and action need to begin now to address current and future impacts. It is clear that water resources are closely connected to what happens in climate change, and for that reason the issue brief is important to all water resources specialists.

The issue brief (August 2014) has been prepared by the Environmental and Energy Study Institute (EESI), and is available at <http://www.eesi.org/papers/view/summarizing-recent-governmental-climate-change-publications>

This study will also be linked on the 2014 Reports and Publications Page of the Sustainable Water Resources Site at <https://sites.google.com/site/sustainablewaterresources/>
