

Implementing an In-Stream Stormwater Monitoring Program to Measure BMP Effectiveness

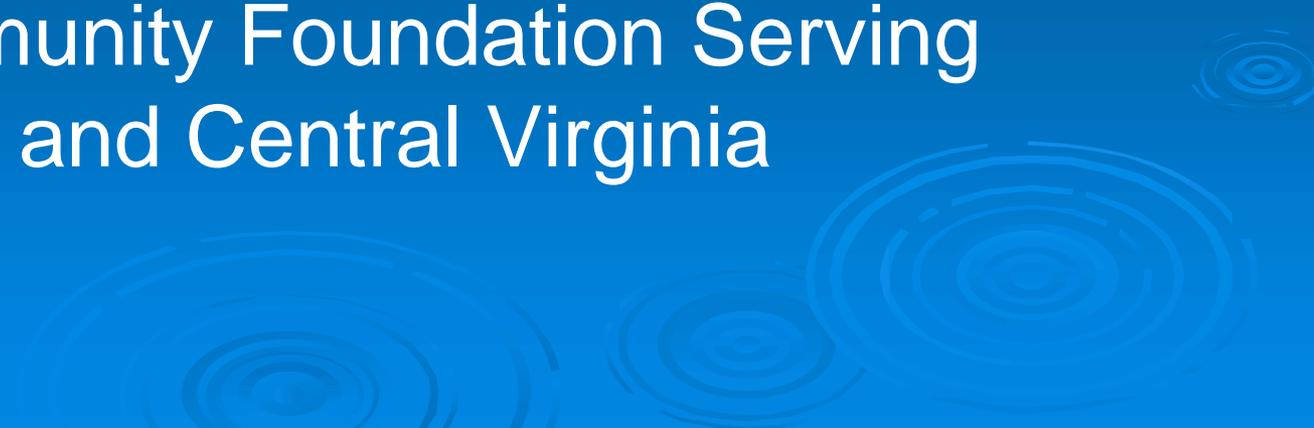

Eighth National Monitoring Conference
4 May 2012

Reedy Creek Watershed

Reedy Creek Land Use

- Approx. 60% impervious surface
- 2 major city parks
- 4 public schools
- Large commercial sector in upper watershed

Reedy Creek Impairment Issues

- Listed Impaired by VA DEQ in 2004 for excessive bacteria levels
 - Listed as “threatened” in 1998
- Lower 1/3rd watershed contributes to Richmond’s Combined Sewer Overflow (CSO) system
- Bacteria TMDL completed
- Bacteria TMDL Implementaton Plan completed (via “Stimulus Funds”)

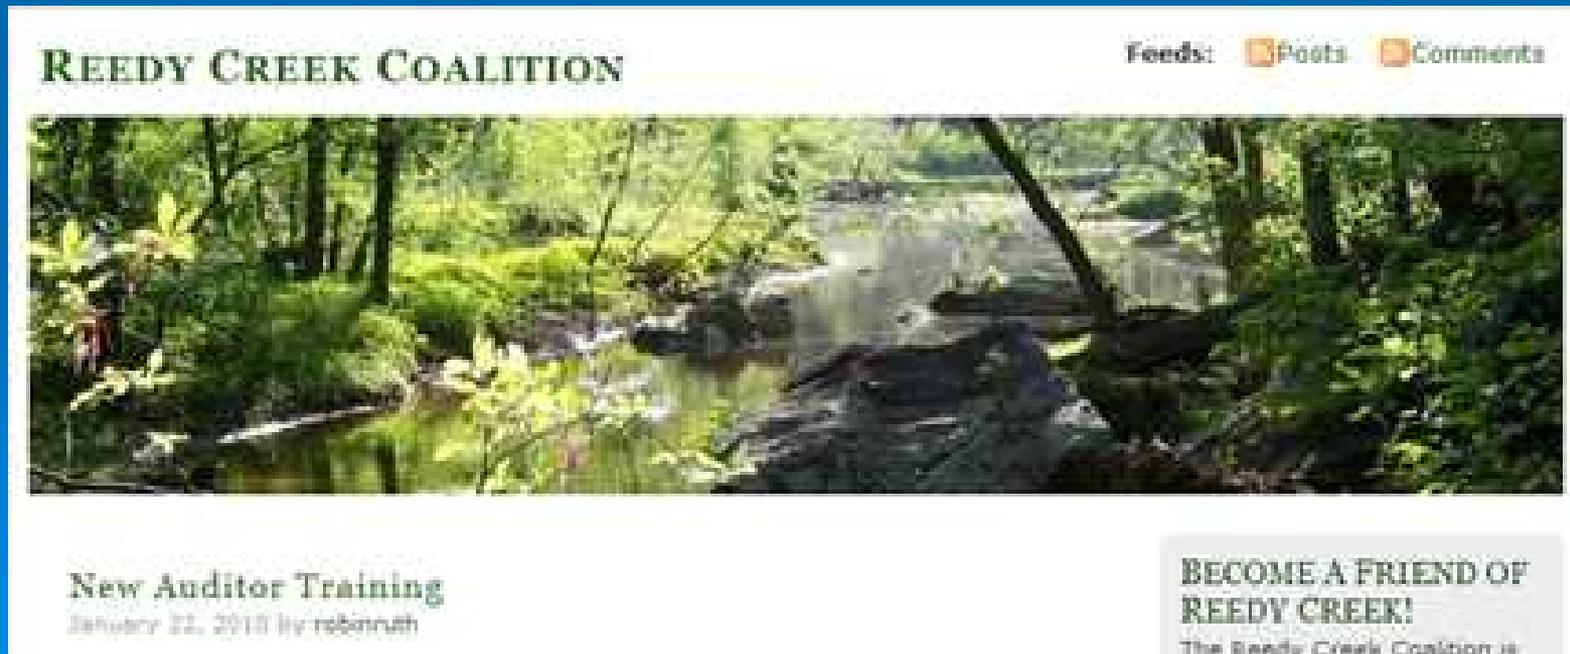

The Catalysts

- Richmond's stormwater utility fee program
- Broad recognition in community that single conservation projects by themselves are good, but measurement of success difficult at watershed level
- Focus on root cause of pollution - Stormwater

Created a Local Watershed Group

➤ The Reedy Creek Coalition

- Watershed residents
- Virginia Commonwealth University (Geography students)
- Alliance for the Chesapeake Bay
- 1 Doctorate Student from Virginia Tech

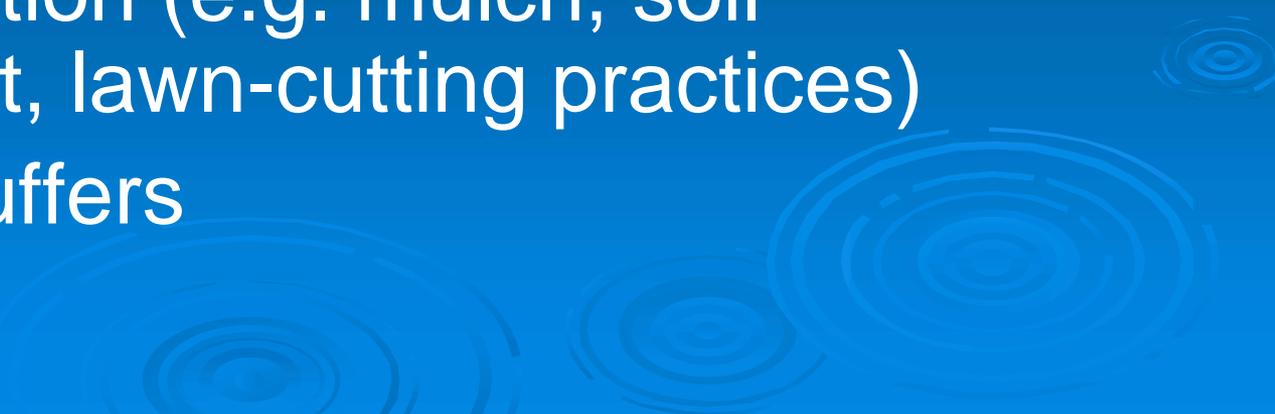

The image is a screenshot of the Reedy Creek Coalition website. At the top left, the text "REEDY CREEK COALITION" is displayed in a dark, serif font. To the right of this text, there are navigation links: "Feeds:" followed by "Posts" and "Comments", each with a small orange square icon. Below the navigation is a large, wide photograph of a stream flowing through a dense forest. The water is clear and reflects the surrounding greenery. In the bottom left corner of the screenshot, there is a text block that reads "New Auditor Training" in a bold, serif font, with "January 22, 2010 by robmuth" underneath in a smaller font. In the bottom right corner, there is a grey rectangular box containing the text "BECOME A FRIEND OF REEDY CREEK!" in a bold, serif font, and "The Reedy Creek Coalition is" in a smaller font below it.

Reedy Creek Coalition

- Working with ACB to develop...
 - Residential stormwater conservation audits
 - Business stormwater conservation audits
 - Stormwater BMP financial incentive program
 - Stream walk surveys
 - IDDE (Illicit Discharge Detection & Elimination)
 - Community outreach activities

Reduce Stormwater Runoff

- Minimize areas of impervious surface (this includes lawns)
 - Capture/redirect stormwater to reduce stream erosion and increase groundwater recharge (Rain barrels, rain gardens, etc.)
 - Manage landscape and lawns to promote water retention (e.g. mulch, soil amendment, lawn-cutting practices)
 - Riparian Buffers
- 

IDDE

- Sewer/Stormwater cross connections detected
- Petroleum discharge into buried headwater stream
 - 120,000 ug/l (ppb) diesel range organics
 - Source yet to be found 2 years later

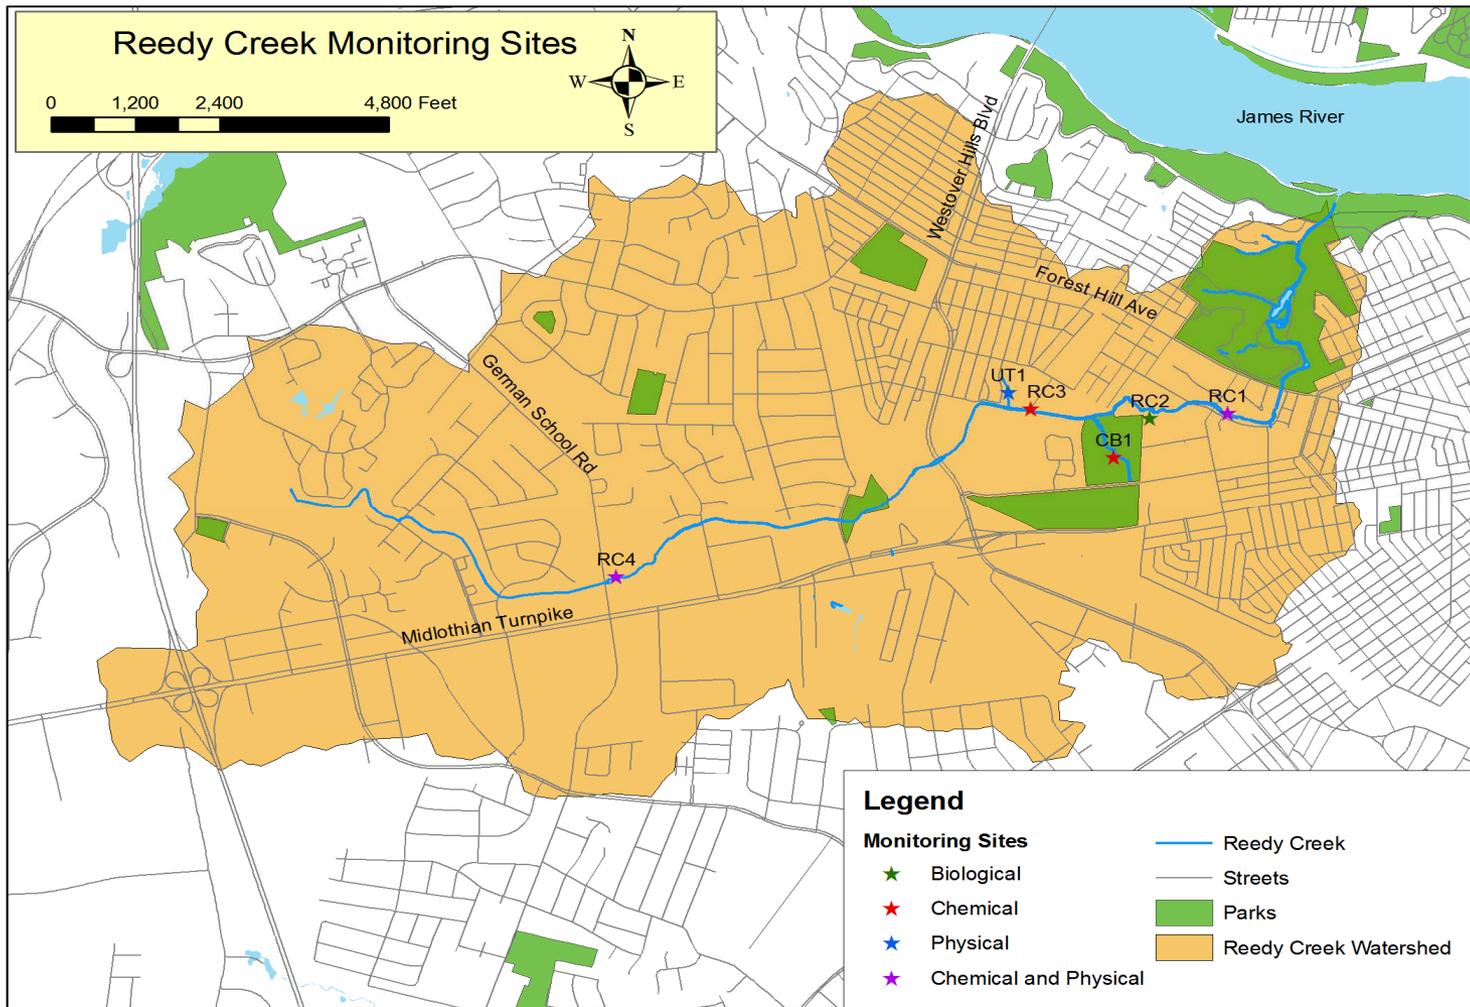

The Role of Volunteer Monitoring

- ...more boots in the field
- ...allows more monitoring sites to be covered
- ...identify illicit discharges
- ...produce high quality data for localities and other resource managers
- ...allows the identification of pollution hotspots
- ...educating and empowering local citizens to become involved in local & Bay restoration efforts

VA DEQ Data Acceptance

- Categories For Non-Agency Data
- Level III - approved by DEQ- (approved QAPP, and use DEQ approved methodologies)
 - Could be used for 303(d) List, TMDL Implementation tracking, Pollution Response (PReP), etc.
- Level II - partially approved-(approved QAPP, use similar but not DEQ approved methods)
 - Could be used in establishing new DEQ sampling stations, for TMDL Implementation tracking, etc.
- Level I - not approved- (no DEQ approved QAPP or methodologies)
 - Used for education or to identify water quality problems for Pollution Response

Reedy Creek Monitoring Stations

Water Monitoring

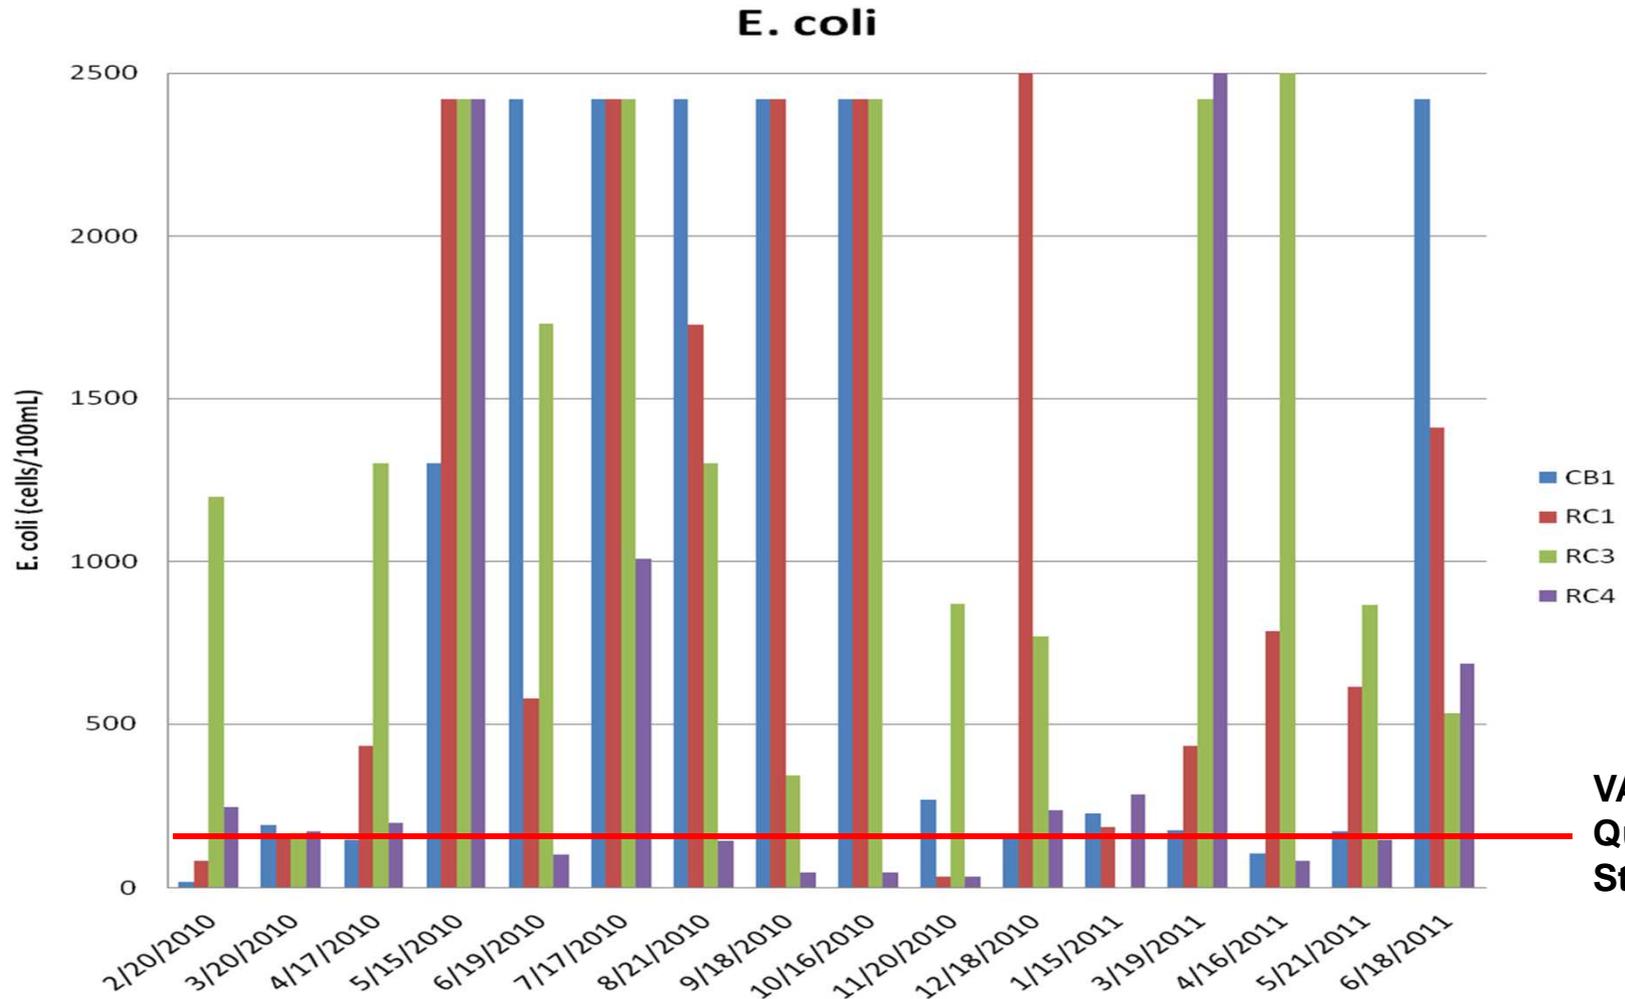

➤ 2 focuses

- Water quality monitoring
 - Nutrients
 - Bacteria
 - Dissolved Oxygen
 - Turbidity
 - Conductivity
 - Benthic macroinvertebrates
- Flow monitoring

Water Monitoring

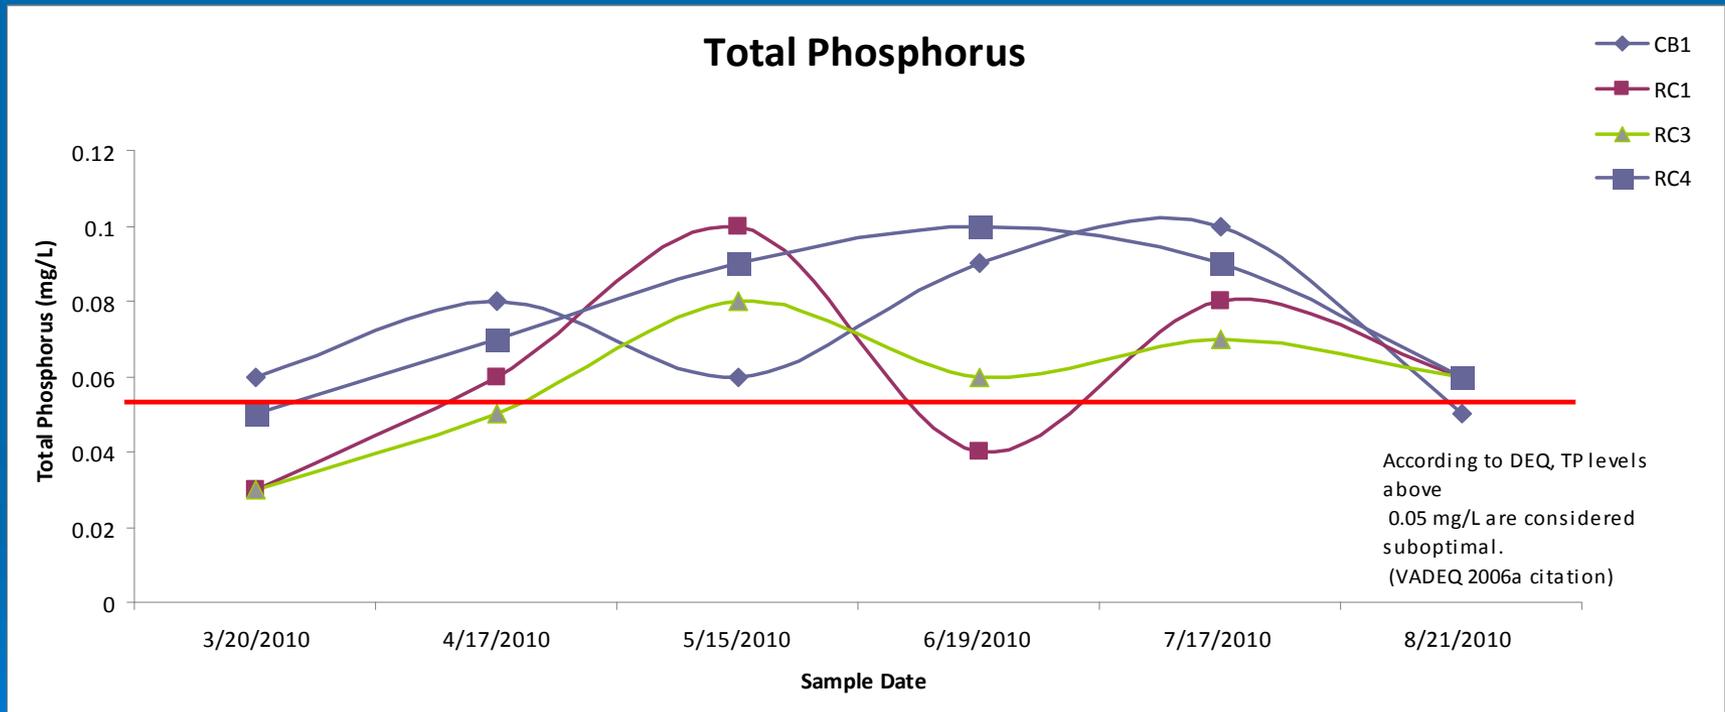

- Samples collected by volunteers under ACB's volunteer water monitoring program (RiverTrends)
 - VA DEQ approved QAPP
 - Partnership with City of Richmond Dept. of Public Utilities (DPU)
 - DPU analyzes most water samples at Richmond WWTP laboratory
- 

Reedy Creek E. coli Data

VA Water
Quality
Standard

Reedy Creek Example

Water Monitoring

- Flow monitoring
- Goal:
 - Document reduction of stormwater flows in Reedy Creek before and after BMP implementation on landscape
 - Modeled on 2006 Burnsville, MN Raingarden Study

Burnsville, MN

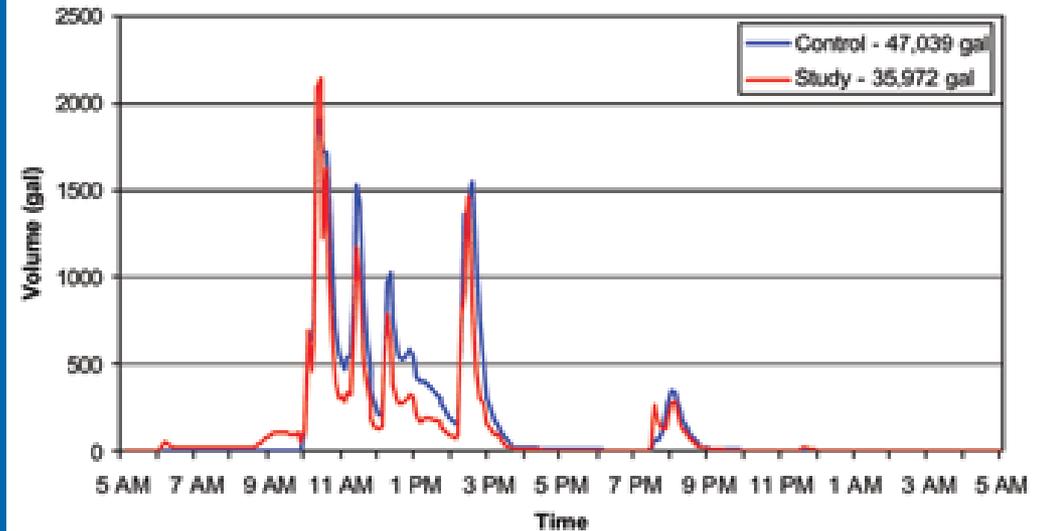

Burnsville, MN Study Results

Pre-Construction Runoff Data

June 6, 2003

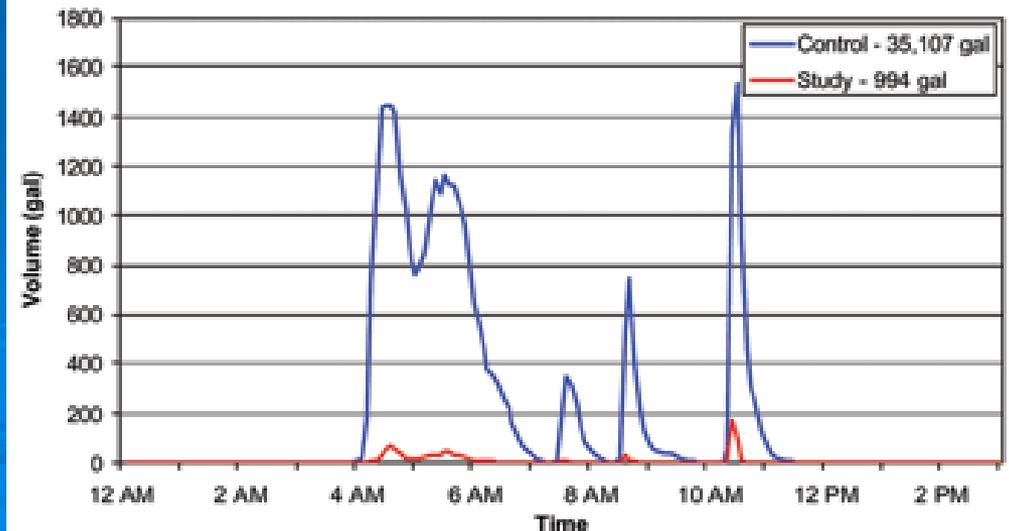

0.50" Rainfall

Post-Construction Runoff Data

May 29, 2004

0.71" Rainfall

Reedy Creek Flow Monitoring

- Using In-Situ probes for monitoring stream flow.
- Pressure Sensor
- 2 rain gages in watershed
 - NBC 12
 - Patrick Henry Charter School

Reedy Creek Flow Monitoring

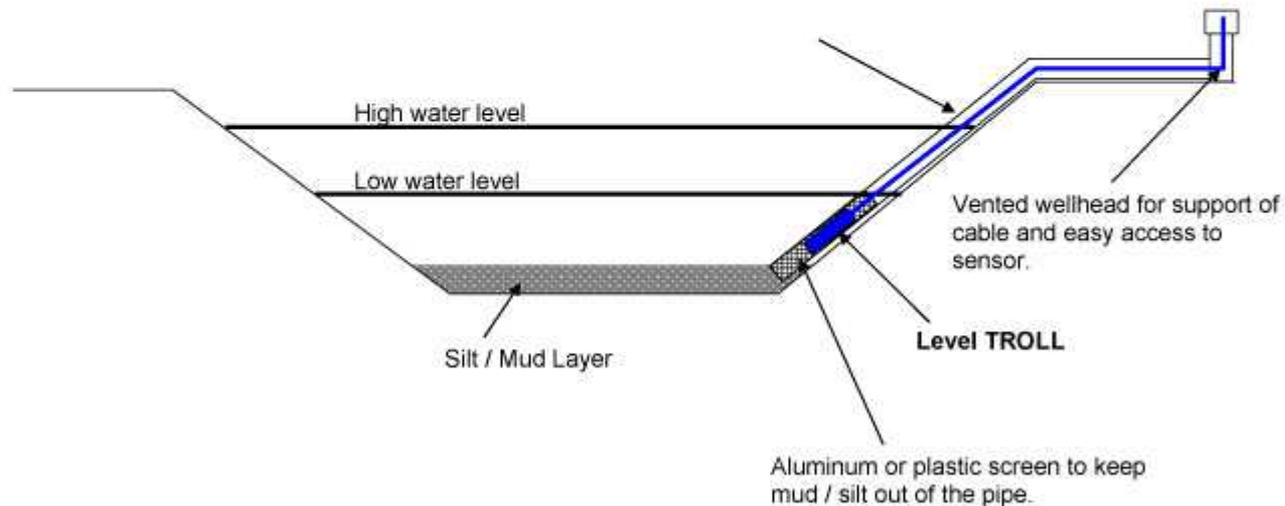

Level TROLL[®] 500

Typical Submersible Sensor Installation in Streams, Lakes and Reservoirs

Option #2

Stilling well constructed of PVC or galvanized steel with holes along bottom length of pipe

Program Challenges

➤ Timeline

- Stormwater conservation efforts expected to take many years before observed recovery
- Bacteria and flow monitoring believed to be most responsive parameters to change

➤ Lose of financial resources/support

➤ Program primarily supported by grants. Need long term funding solution.
