Presentation Outline

- Purpose and design of the New England SPARROW models
- Results & applications

Purpose of the New England SPARROW is to support major water-quality management activities

- Nutrient criteria development - Ranges in nutrient concentrations in rivers and streams
- TMDL program - Identification of factors (sources and watershed characteristics) affecting nutrient loads
- Coastal Water Assessments - Transport of nutrients by rivers (especially interstate) to coastal waters

Design of the New England SPARROW

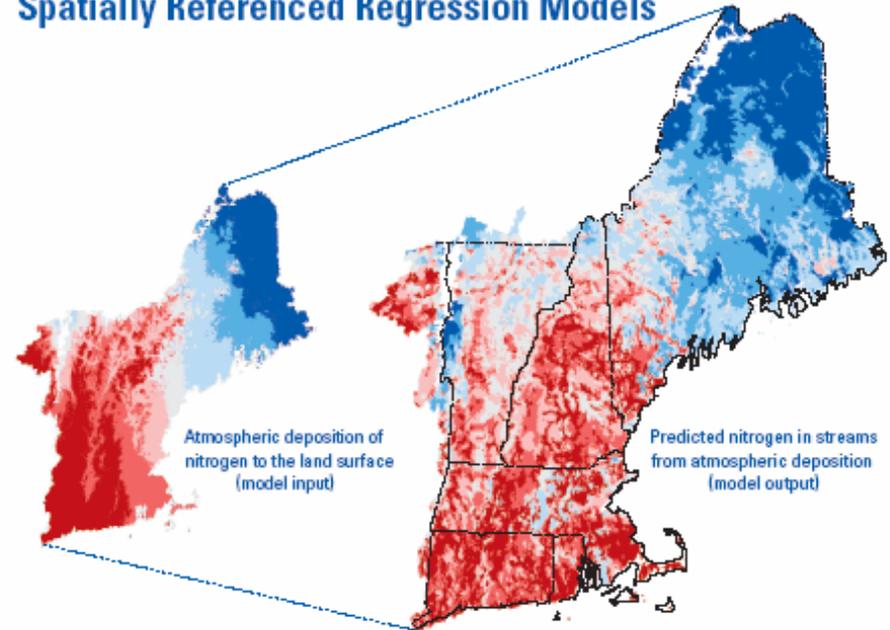

- Focus on Total Nitrogen and Phosphorus loads
- Model for the mid-1990s time period

In cooperation with the
New England Interstate Water Pollution Control Commission and
U.S. Environmental Protection Agency

Estimation of Total Nitrogen and Phosphorus in New England Streams Using Spatially Referenced Regression Models

Scientific Investigations Report 2004-5012

U.S. Department of the Interior
U.S. Geological Survey

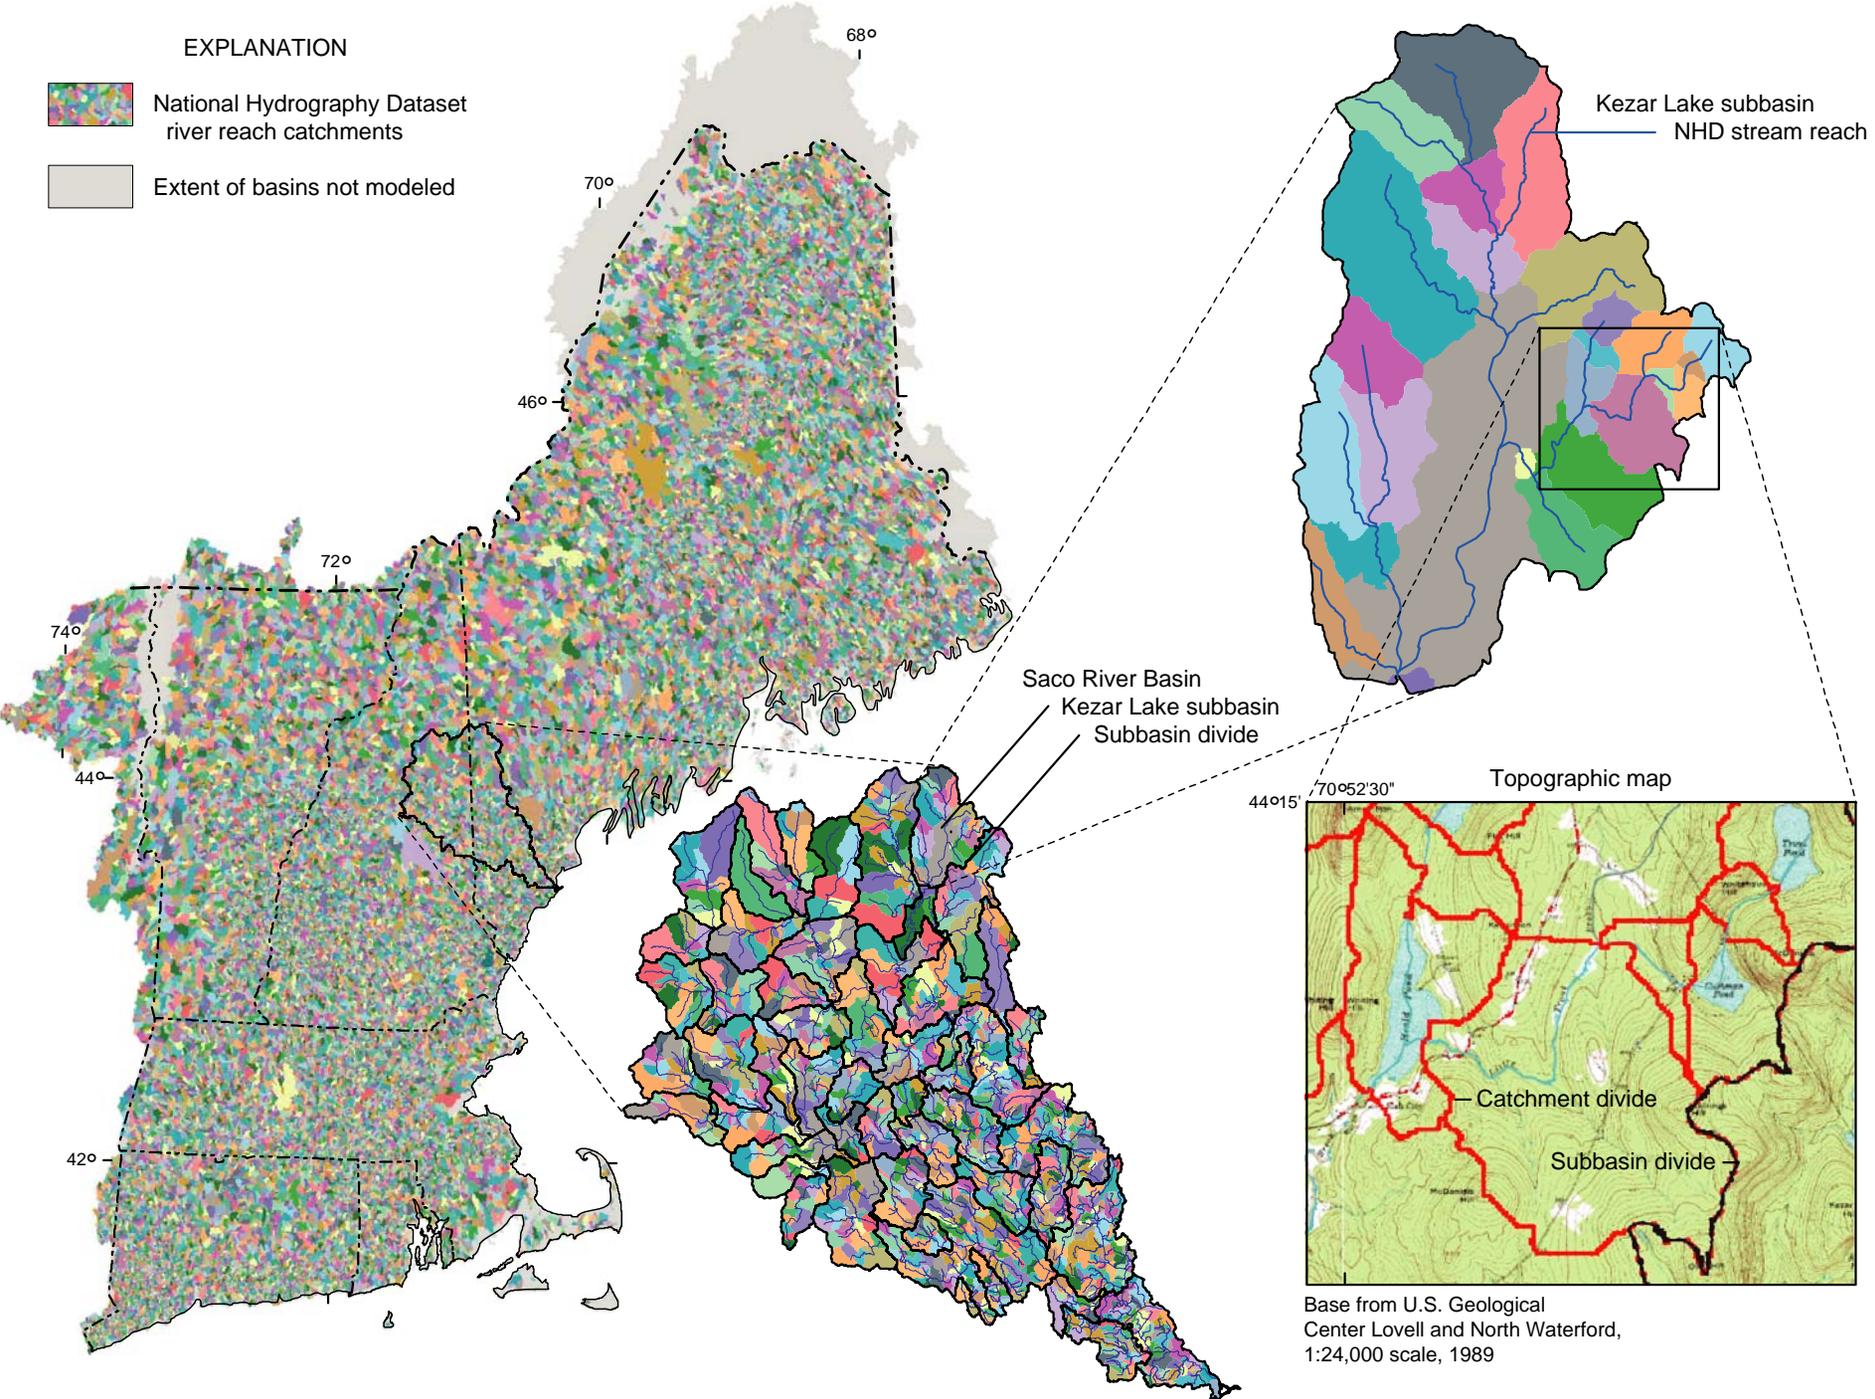

New England Model Framework of Catchments and Streams Reaches

- Based on the National Hydrography Data Set (NHD)
- Approx 42,000 in model
- Average 1.7 mi² in size
- Corrected to NRCS 12-digit watershed boundary dataset

EXPLANATION

-  National Hydrography Dataset river reach catchments
-  Extent of basins not modeled

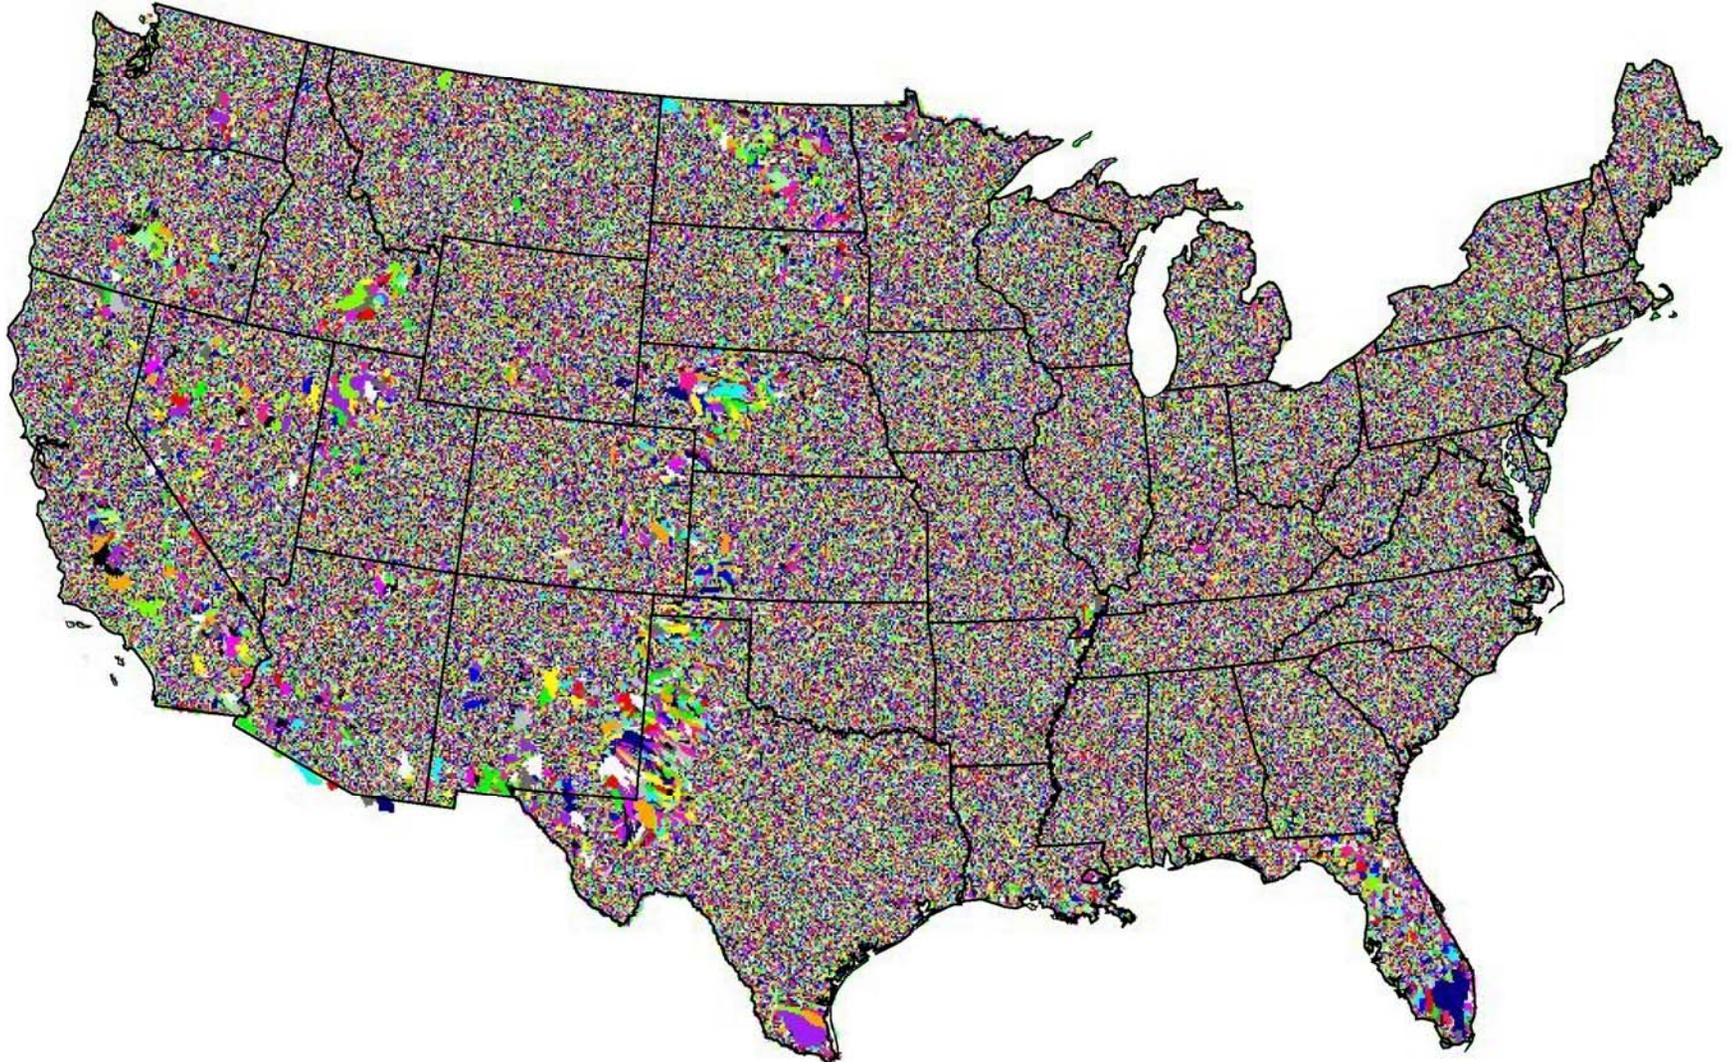

Base from U.S. Geological Center Lovell and North Waterford, 1:24,000 scale, 1989

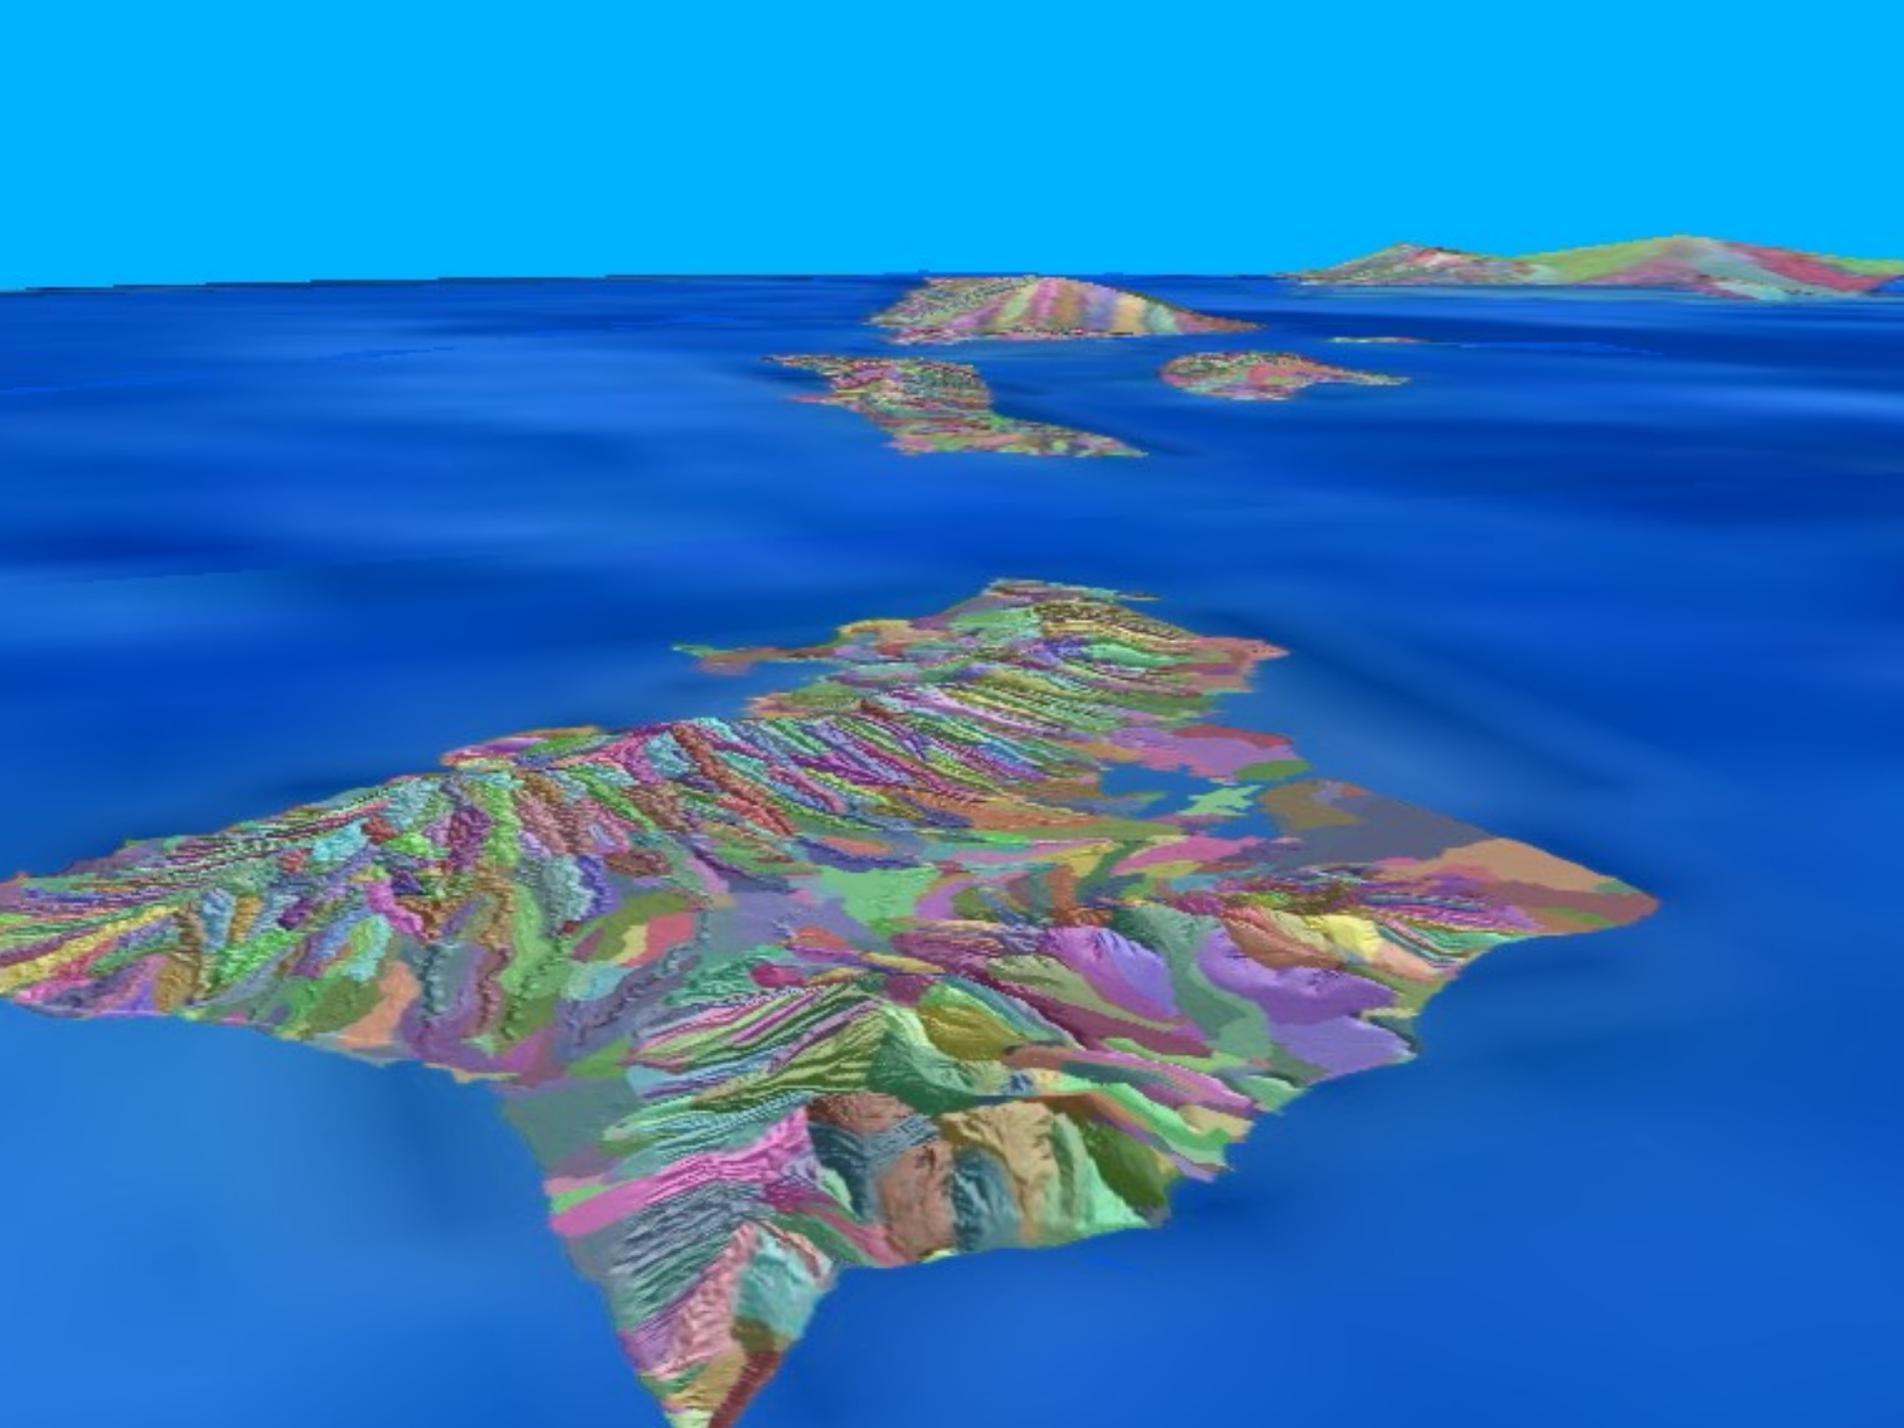

National Pilot Study for NHD catchment delineation

- New England method typically gives the most accurate results
- Is being applied nationally as part of NHDPlus!

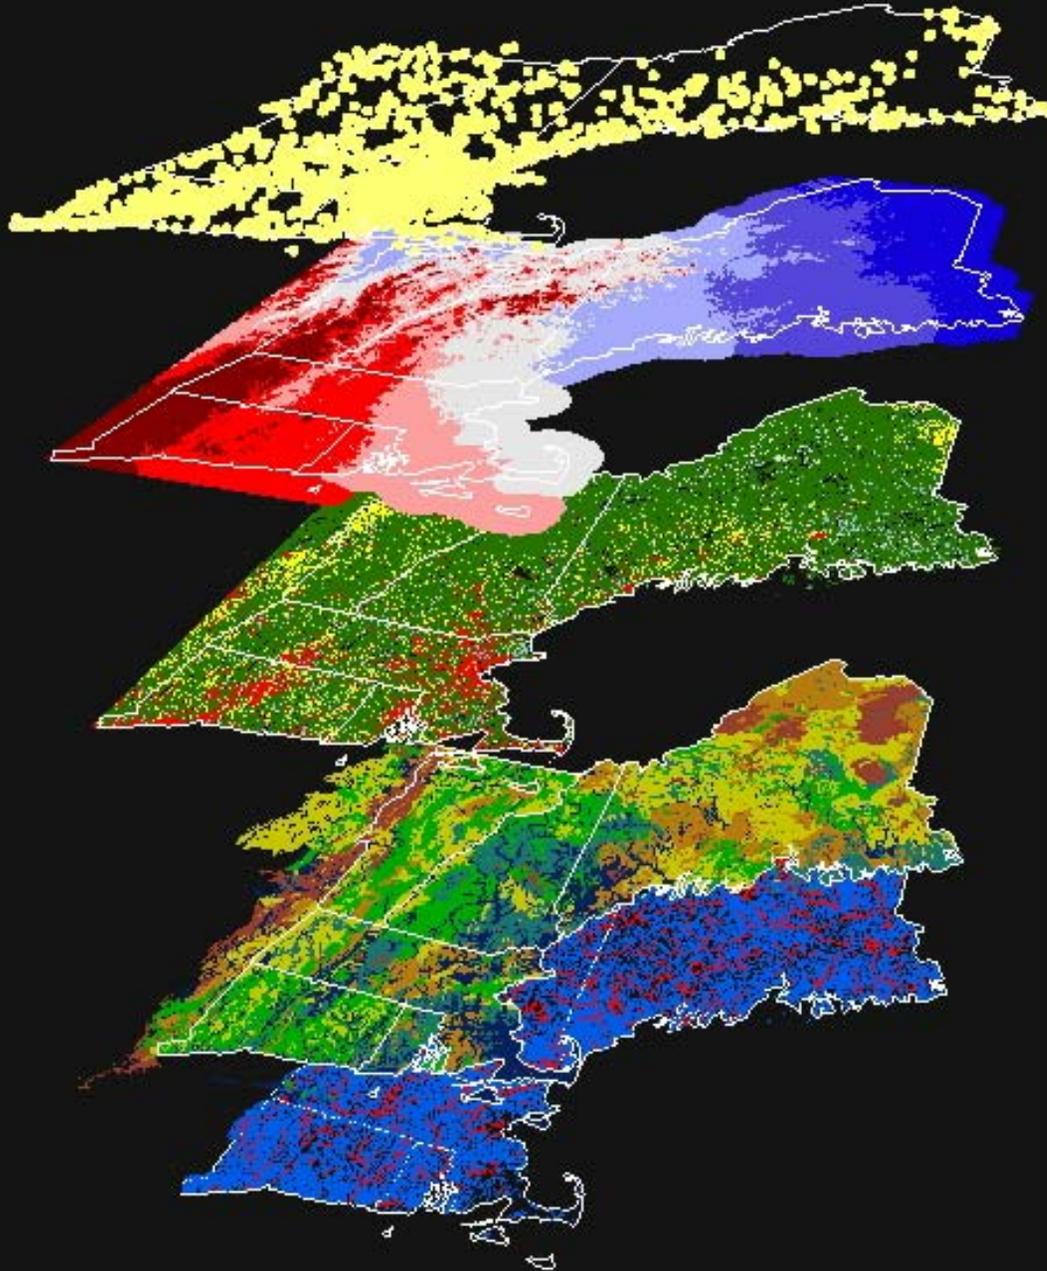

A National Seamless Database of
Topographically Derived Catchments
part of the 1:100,000-scale NHDPlus
2,613,709 catchments

NE SPARROW Model Input

Nutrient Sources

Point Source

Atmospheric deposition of nitrogen (Ollinger 1992)

National Land Cover Dataset 1992

- Agriculture
- Developed
- Forest

Processes

Land to water delivery

Soil permeability –
STATSGO

In-stream loss

Stream travel time
Reservoir detention

Model Calibration Results for the New England SPARROW Nitrogen Model

R-squared = .95, MSE = 0.16

Variable	Bootstrap model coefficient	Standard error of coefficient	p-value
SOURCES			
Municipal wastewater- treatment facilities	1.13	0.36	<.005
Atmospheric deposition	.36	.07	<.005
Agricultural land (kg/km²/y)	910	362	.005
Developed land (kg/km²/y)	988	385	.010

Model Calibration Results for the New England SPARROW Nitrogen Model (cont.)

R-squared = .95, MSE = 0.16

Variable	Bootstrap model coefficient	Standard error of coefficient	p-value
Delivery variable: Natural Log of Soil Permeability	0.36	0.14	<.005
Decay Variable: Stream decay for streams \leq 100 cfs (per day)	.71	.52	.065

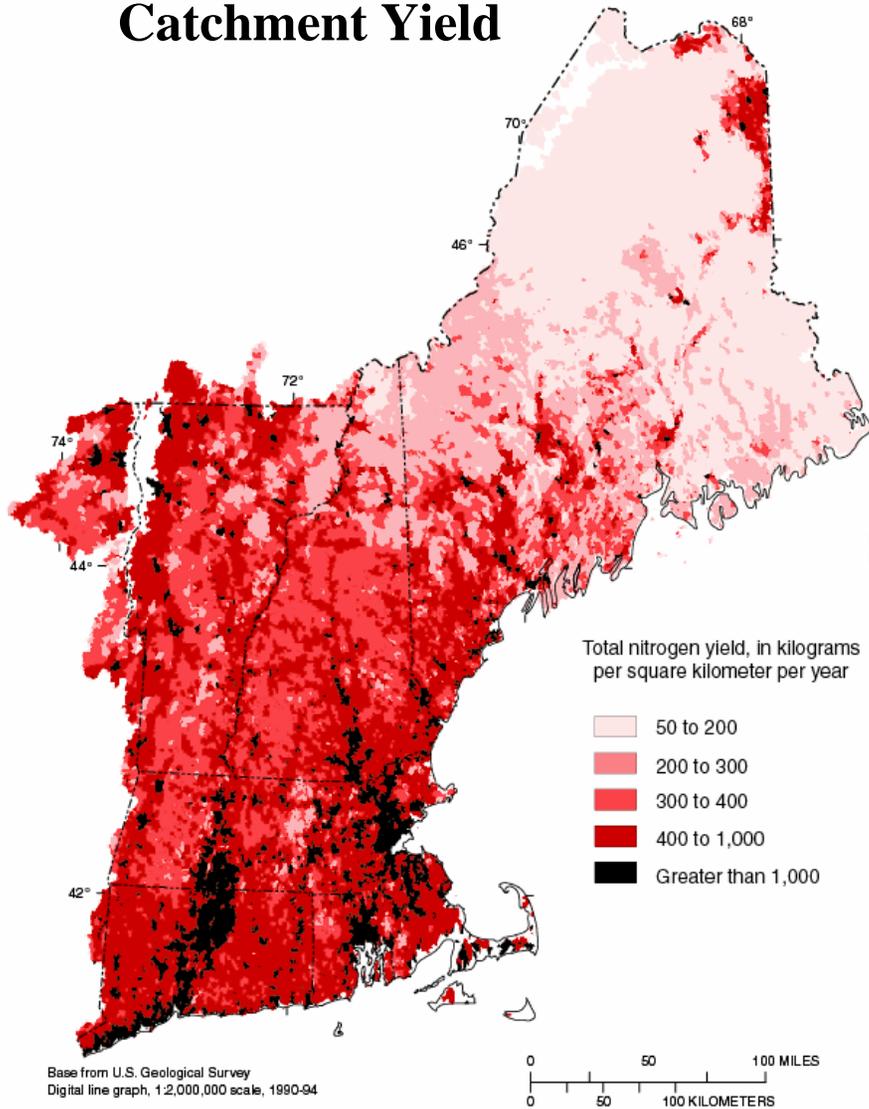

Application of SPARROW Results

SPARROW nutrient load predictions
are made for 42,000 reaches
throughout New England

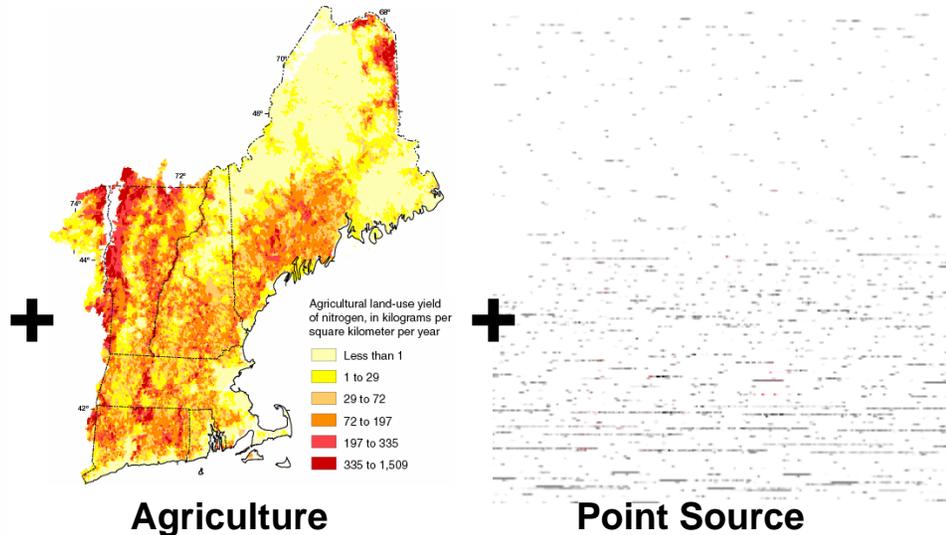

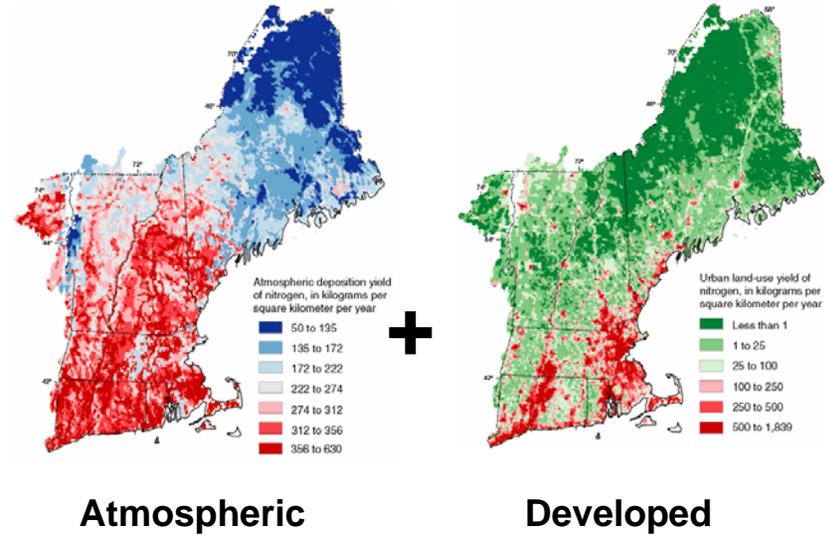

SPARROW Model Results:

Predicted Total Nitrogen Catchment Yield

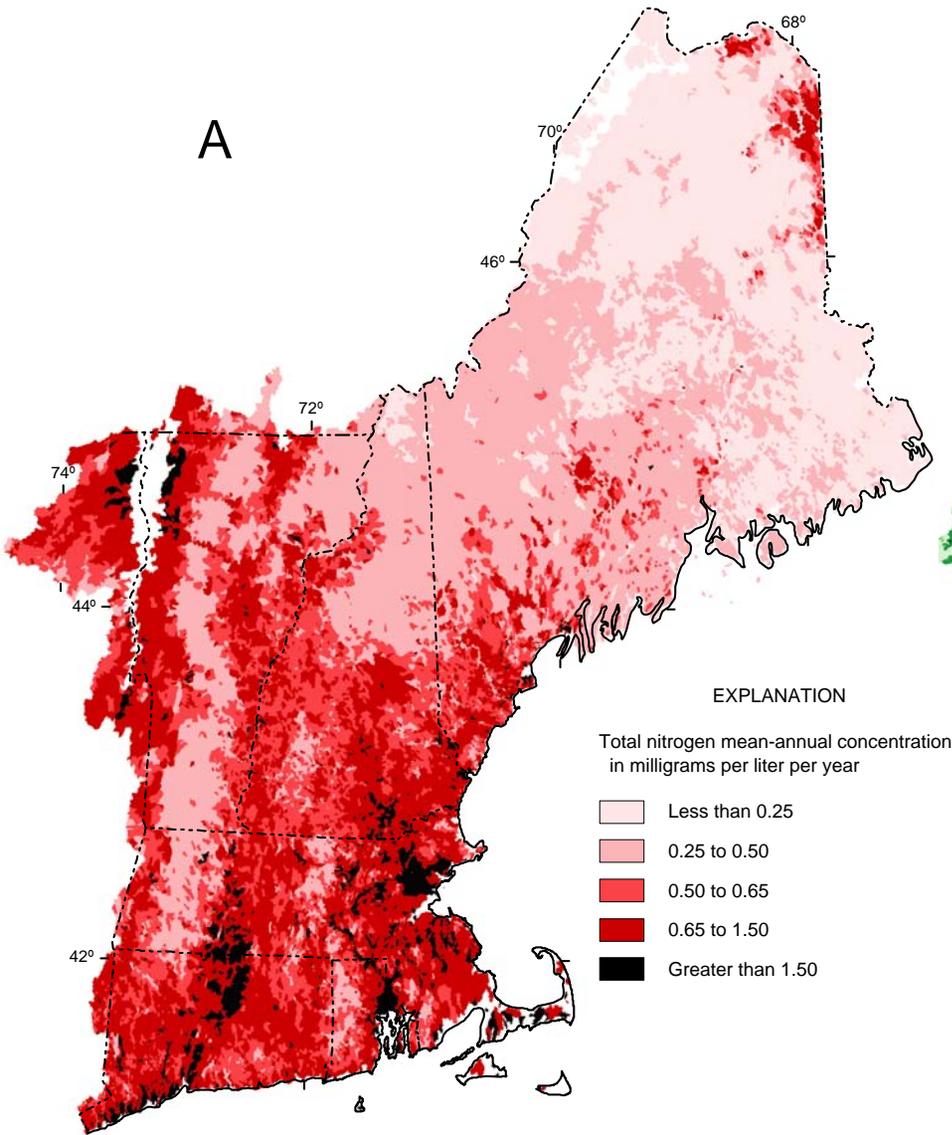

Contributions to Total Nitrogen from each source

Applications

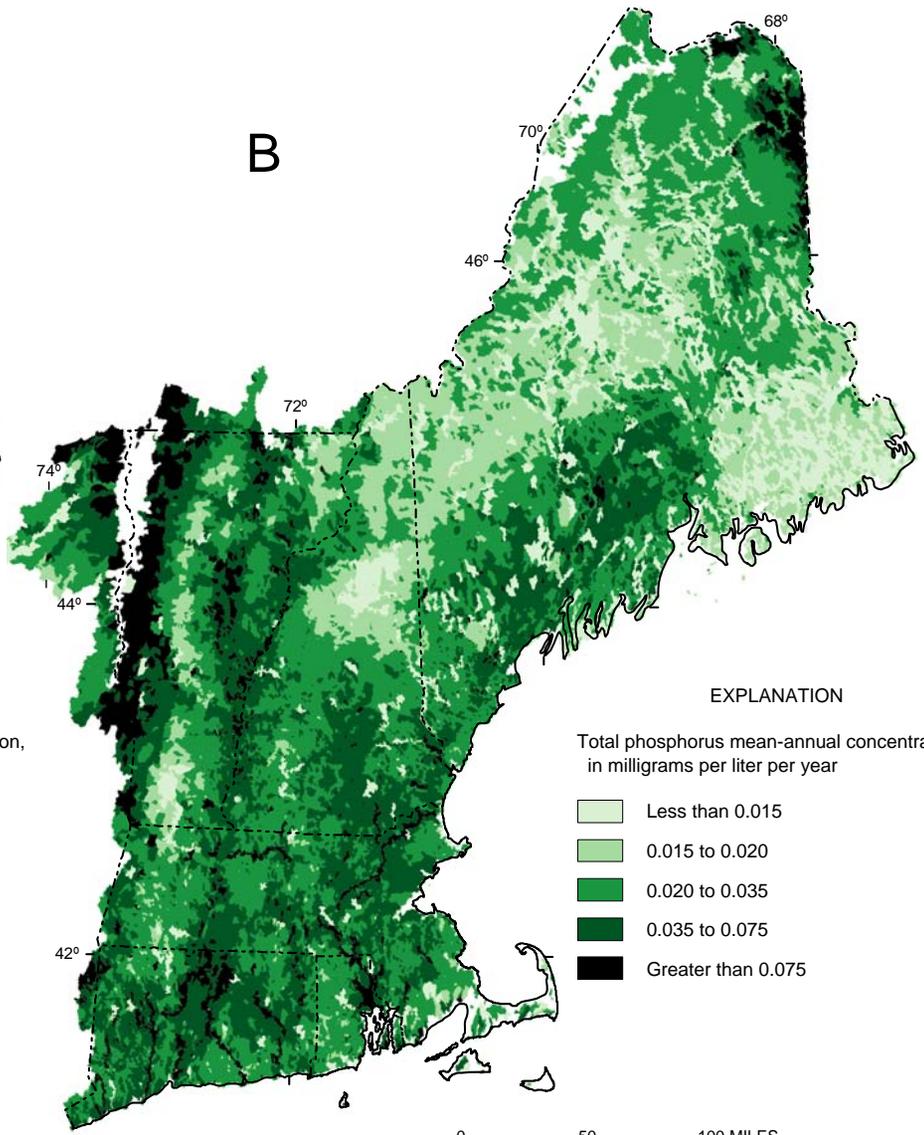

- SPARROW results can be expressed in terms of concentration (mean-annual flow-weighted)

EXPLANATION

Total nitrogen mean-annual concentration, in milligrams per liter per year

- Less than 0.25
- 0.25 to 0.50
- 0.50 to 0.65
- 0.65 to 1.50
- Greater than 1.50

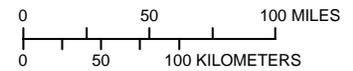

EXPLANATION

Total phosphorus mean-annual concentration, in milligrams per liter per year

- Less than 0.015
- 0.015 to 0.020
- 0.020 to 0.035
- 0.035 to 0.075
- Greater than 0.075

Base from U.S. Geological Survey
Digital line graph, 1:2,000,000 scale, 1990-94

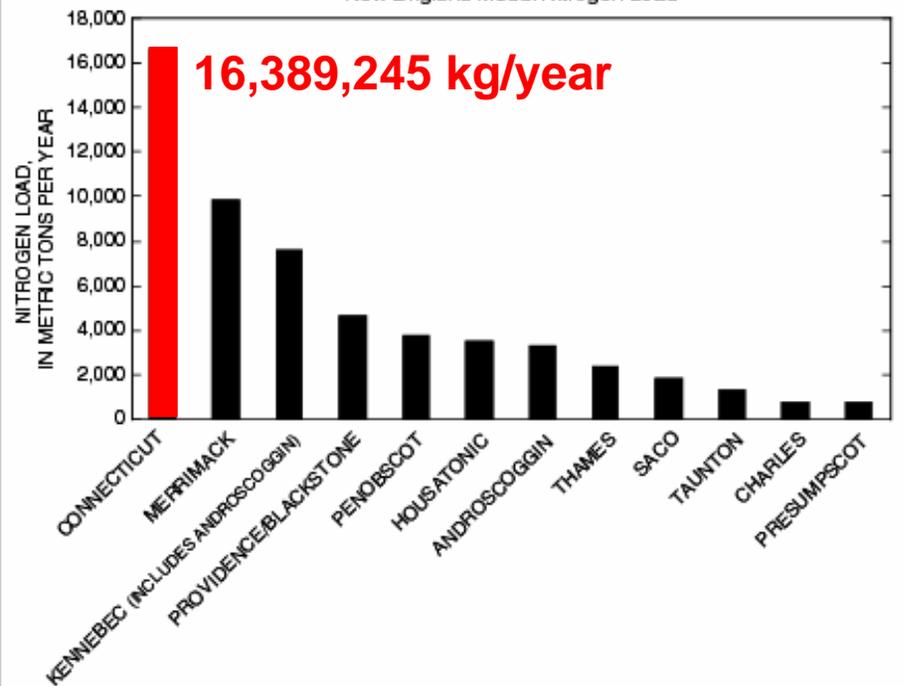

NE SPARROW applications by other investigators

- In Vermont - Nutrient Criteria work relating NE Sparrow results and VT Nutrient Criteria Dataset for phosphorus in lakes and streams.
- In New Hampshire - study by conservation organizations to identify "pristine" watersheds with higher priority for protection.

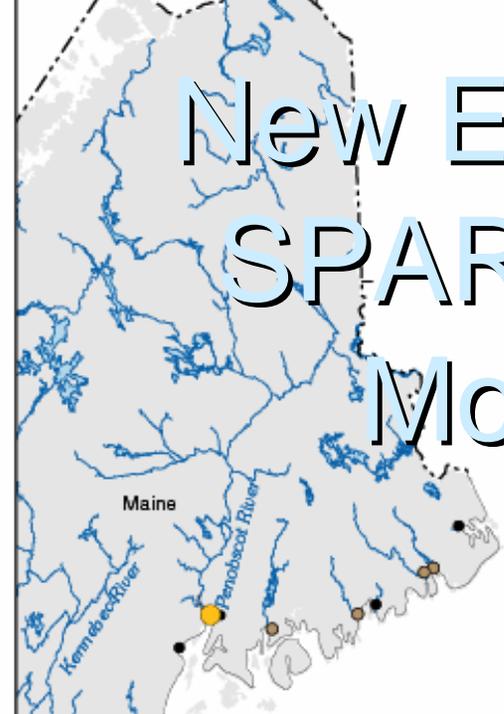

Applications (cont.)

- SPARROW results are useful in evaluating load assessments to receiving waters

New England Model Nitrogen Load

New England SPARROW Model

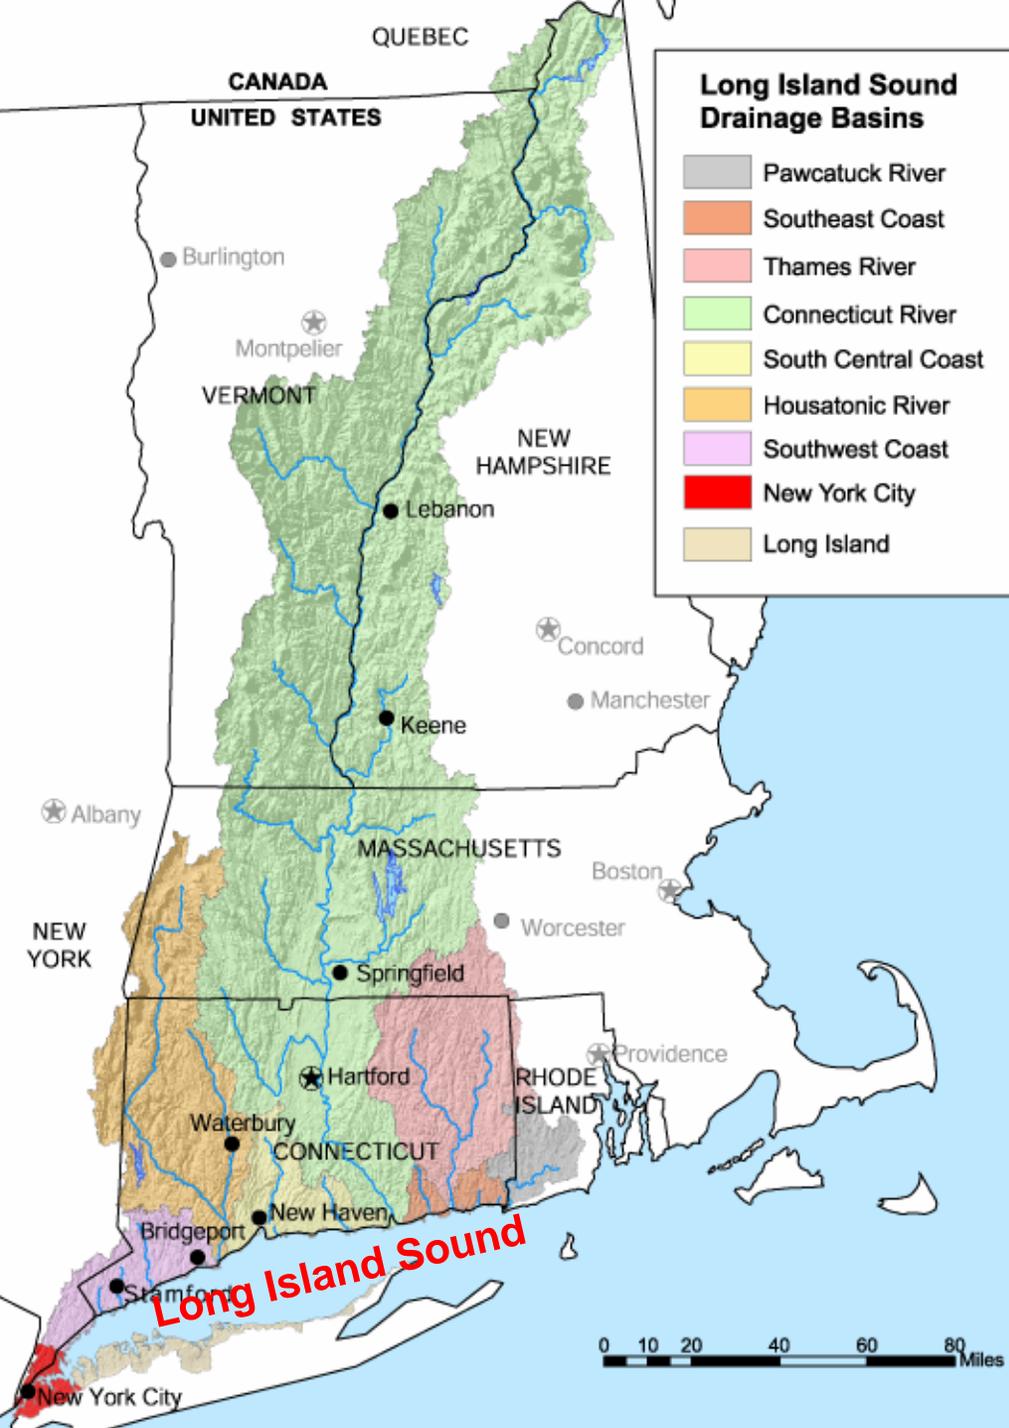

EXPLANATION

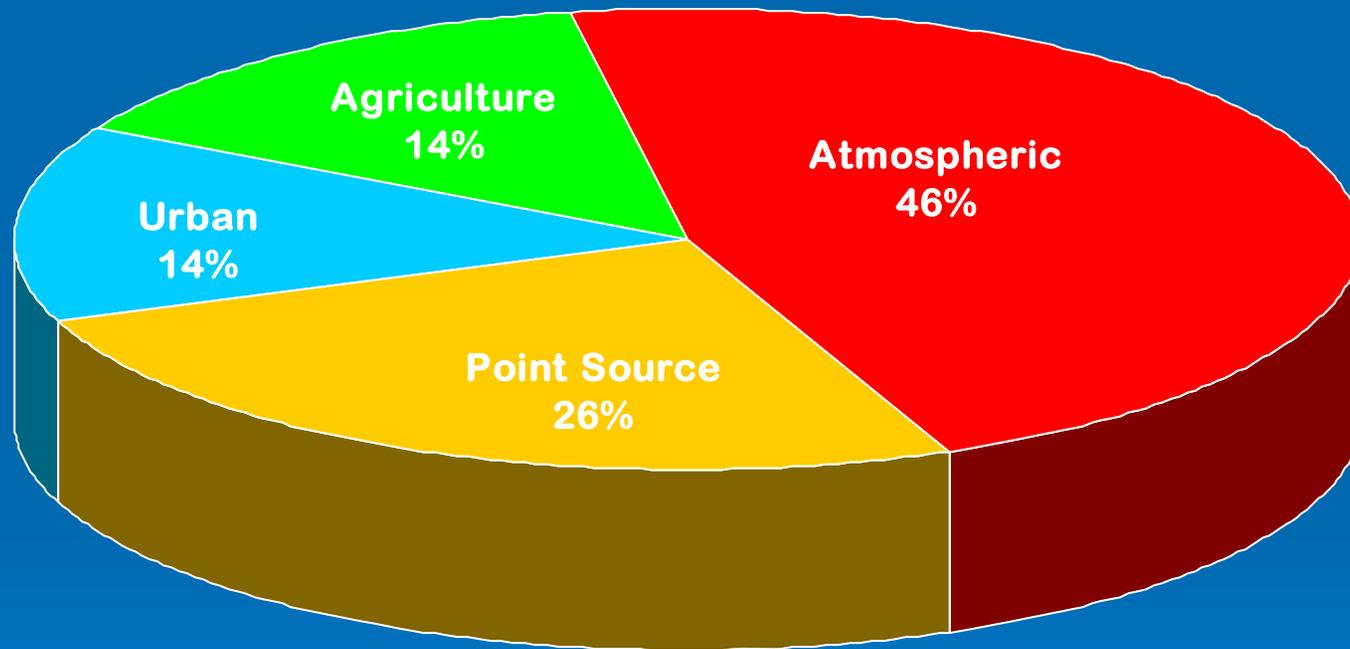

Nitrogen load sites, in metric tons per year

- 30 to 100
- 100 to 250
- 250 to 1,000
- 1,000 to 3,000
- 3,000 to 8,000
- 8,000 to 16,200

Connecticut River Nitrogen Loading Assessment

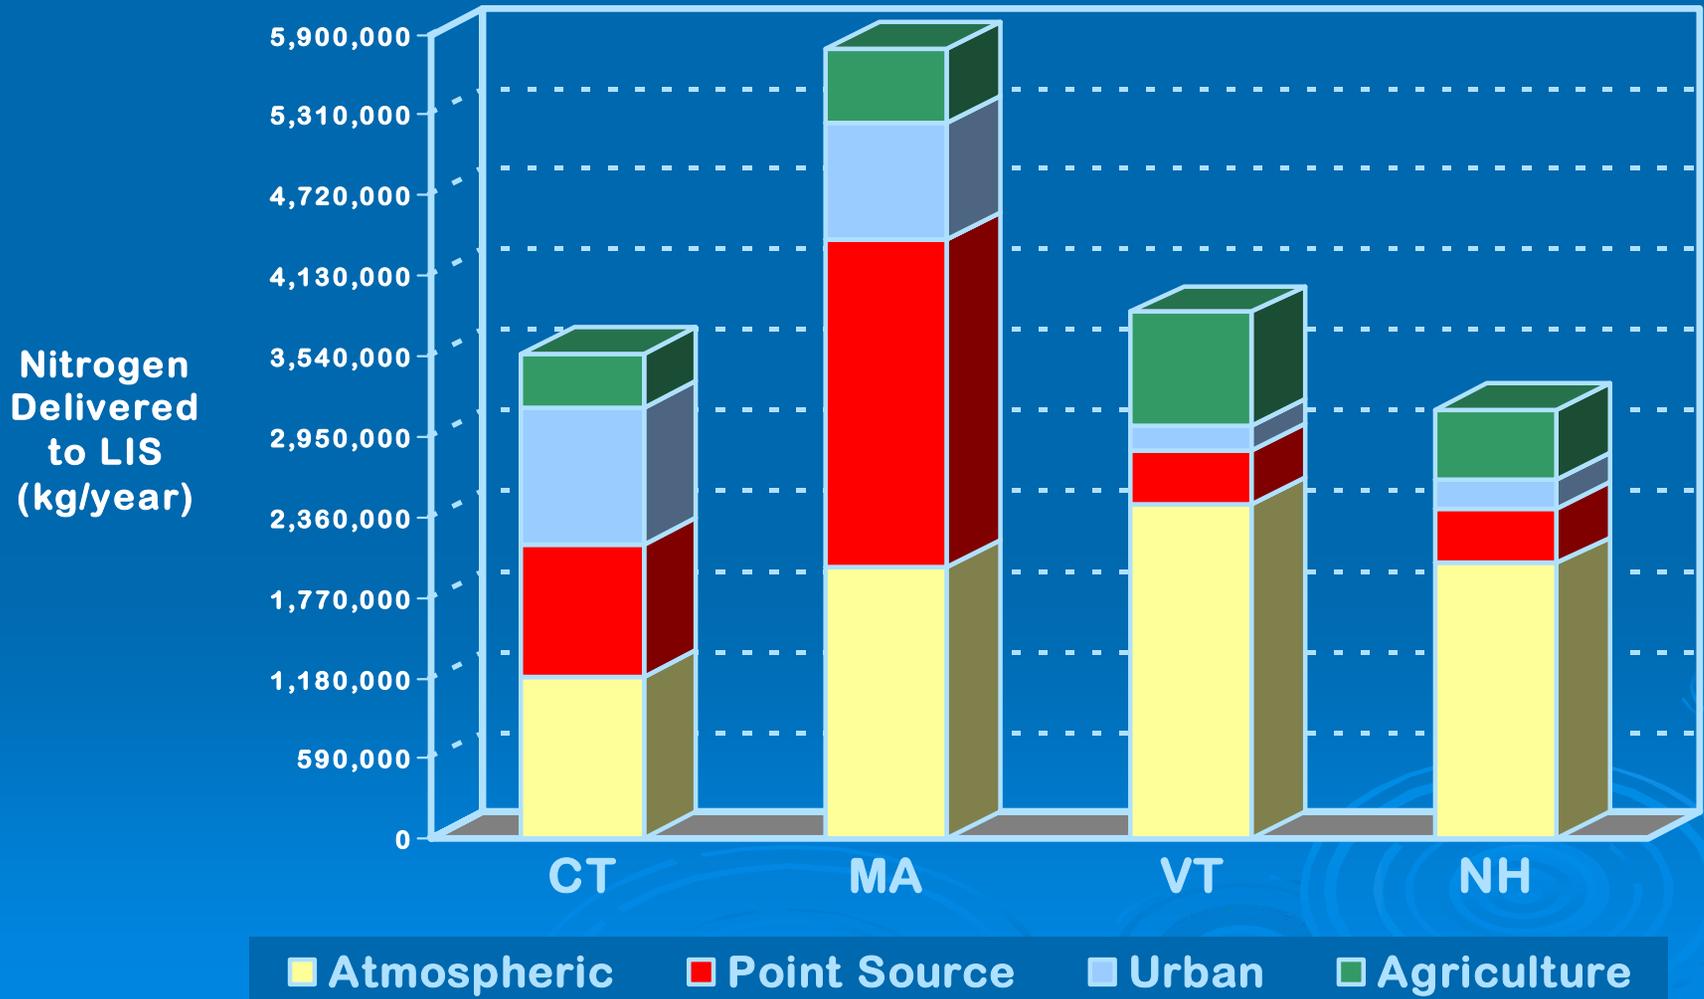

Predicted Sources of Nitrogen Loading in Connecticut River Watershed to LIS

NE SPARROW applications by other investigators

- Long Island Sound TMDL program
- two related USGS / NEIWPC projects
 - nutrient loads in the upper CT basin
 - rate of nitrogen loss in selected reaches

Predicted Nitrogen Load Delivered to LIS from Connecticut River Watershed States

NE SPARROW applications by other investigators

- SPARROW input data is being used to help identify relations between observed mercury concentrations in water and sediment throughout New England.

NE SPARROW applications by other investigators

- Studies by Atlantic Ecology Division of the U.S. EPA Office of Research and Development
 - Linking SPARROW results to EPA's Coastal Waters Assessment for the New England region
 - proposed work to combine regional information from SPARROW models with EPAs probability surveys

NE SPARROW applications by other investigators

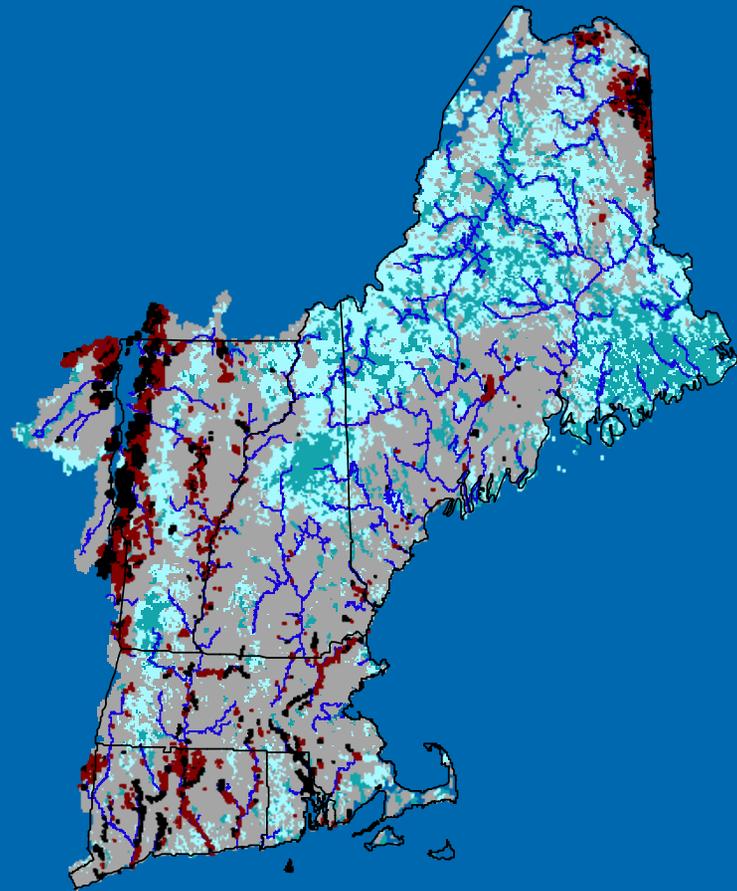

- New England SPARROW model is being used to assess contributions from headwater reaches on flows and nutrient loads in the major rivers (of importance to on-going discussions of Federal Clean Water Act)

Applications (cont.)

- SPARROW quantified estimates of uncertainty
- Results can be expressed in terms of probability of exceeding a specific mean-annual concentration

SPARROW

Probability of
exceeding a
specific
mean-annual
concentration

Probability of exceeding 0.05 mg/l Phosphorus

Conclusion

The detail and functionality of the NHD (NHDPlus) combined with SPARROW modeling capabilities produces an excellent water-quality modeling tool with numerous applications
