Outline

- Introduction
- Water Quality
 - Coral reef
- *Visible Infrared Imaging Radiometer Suite* (VIIRS)
 - Sensor products
 - Virtual Areas
- Results
- Conclusions

Remote Sensing

Benefits of remote sensing:

- collect information over large and remote spatial areas
- characterize natural features or physical objects on the ground
- systematic observation of surface areas and objects
- monitor their changes over time
- integrate data with other information to aid decision-making
- cost effective technologies.

Water Quality

Land based sources of pollution (LBSP) are a major threat to corals:

- Cause disease and mortality
- Disrupt critical ecological reef functions that impede growth and reproduction and larval settlement.
- Innovations in Monitoring and Assessment.
- Connecting Coasts, Estuaries, and Freshwater Ecosystems.
- Identifying and Assessing Emerging Risks.
- Measuring Effectiveness of Water Management Actions.

Guanica Bay, Puerto Rico Credit: NOAA

VIIRS

- NOAA National Environmental Satellite, Data, and Information Service (NESDIS) operational satellite.
- Spectral coverage: 412nm -12 μm
- 22 bands, 750m, 375m spatial res.
- Daily images
- Products:
 - Cloud cover, aerosols
 - Land & ocean biosphere
 - Sea Surface Temperature
 - Fire detection
 - Imagery

Visible Infrared Imager Radiometer Suite (VIIRS)

NASA/GSFC

Suomi NPP VIIRS Global Chlorophyll Composite

Boreal Summer 21 Jun 2012 - 20 Sep 2012

Austral Summer 21 Dec 2011 - 20 Mar 2012

Chlorophyll (mg / m³)
0.01 0.05 0.1 1 10

NASA/Suomi/NPP/Norman Kuring

VIIRS

- **Chlorophyll-*a* (Chl-*a*)**
 - Monitoring phytoplankton biomass.
 - Nutrient status (*i.e.* **productivity**).
 - Index of water quality.
- **Kd(490)**
 - Diffuse attenuation coefficient at 490nm.
 - **Turbidity**
(measure of the total organic and inorganic matter held in solution and suspension).
 - Index of water quality.

Kd_490 (m^{-1})

VIIRS Kd(490) product image for Puerto Rico and the USVI after a precipitation event (August 26, 2014).

Why use VIIRS for Water Quality?

- The color of coastal water is related to water quality.
- Satellite ocean color data provide a synoptic view of water quality.
- Continuous monitoring
- Ocean color tools that managers and stakeholders can use to:
 - Track water quality near their reefs
 - Evaluate effect in the coastal water due to changes in the watershed. (“Ridge to Reef”).

Study Area

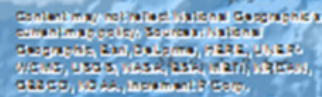

U.S. Coral Reef Task Force priority watershed sites:

- Ka'anapali (West Maui, Hawai'i)
- Faga'alu (American Samoa)
- Guánica Bay (Puerto Rico).

US Coral Reef Task Force Priority Watersheds

Guánica and La Parguera Area (Puerto Rico).

Water Quality Products from VIIRS

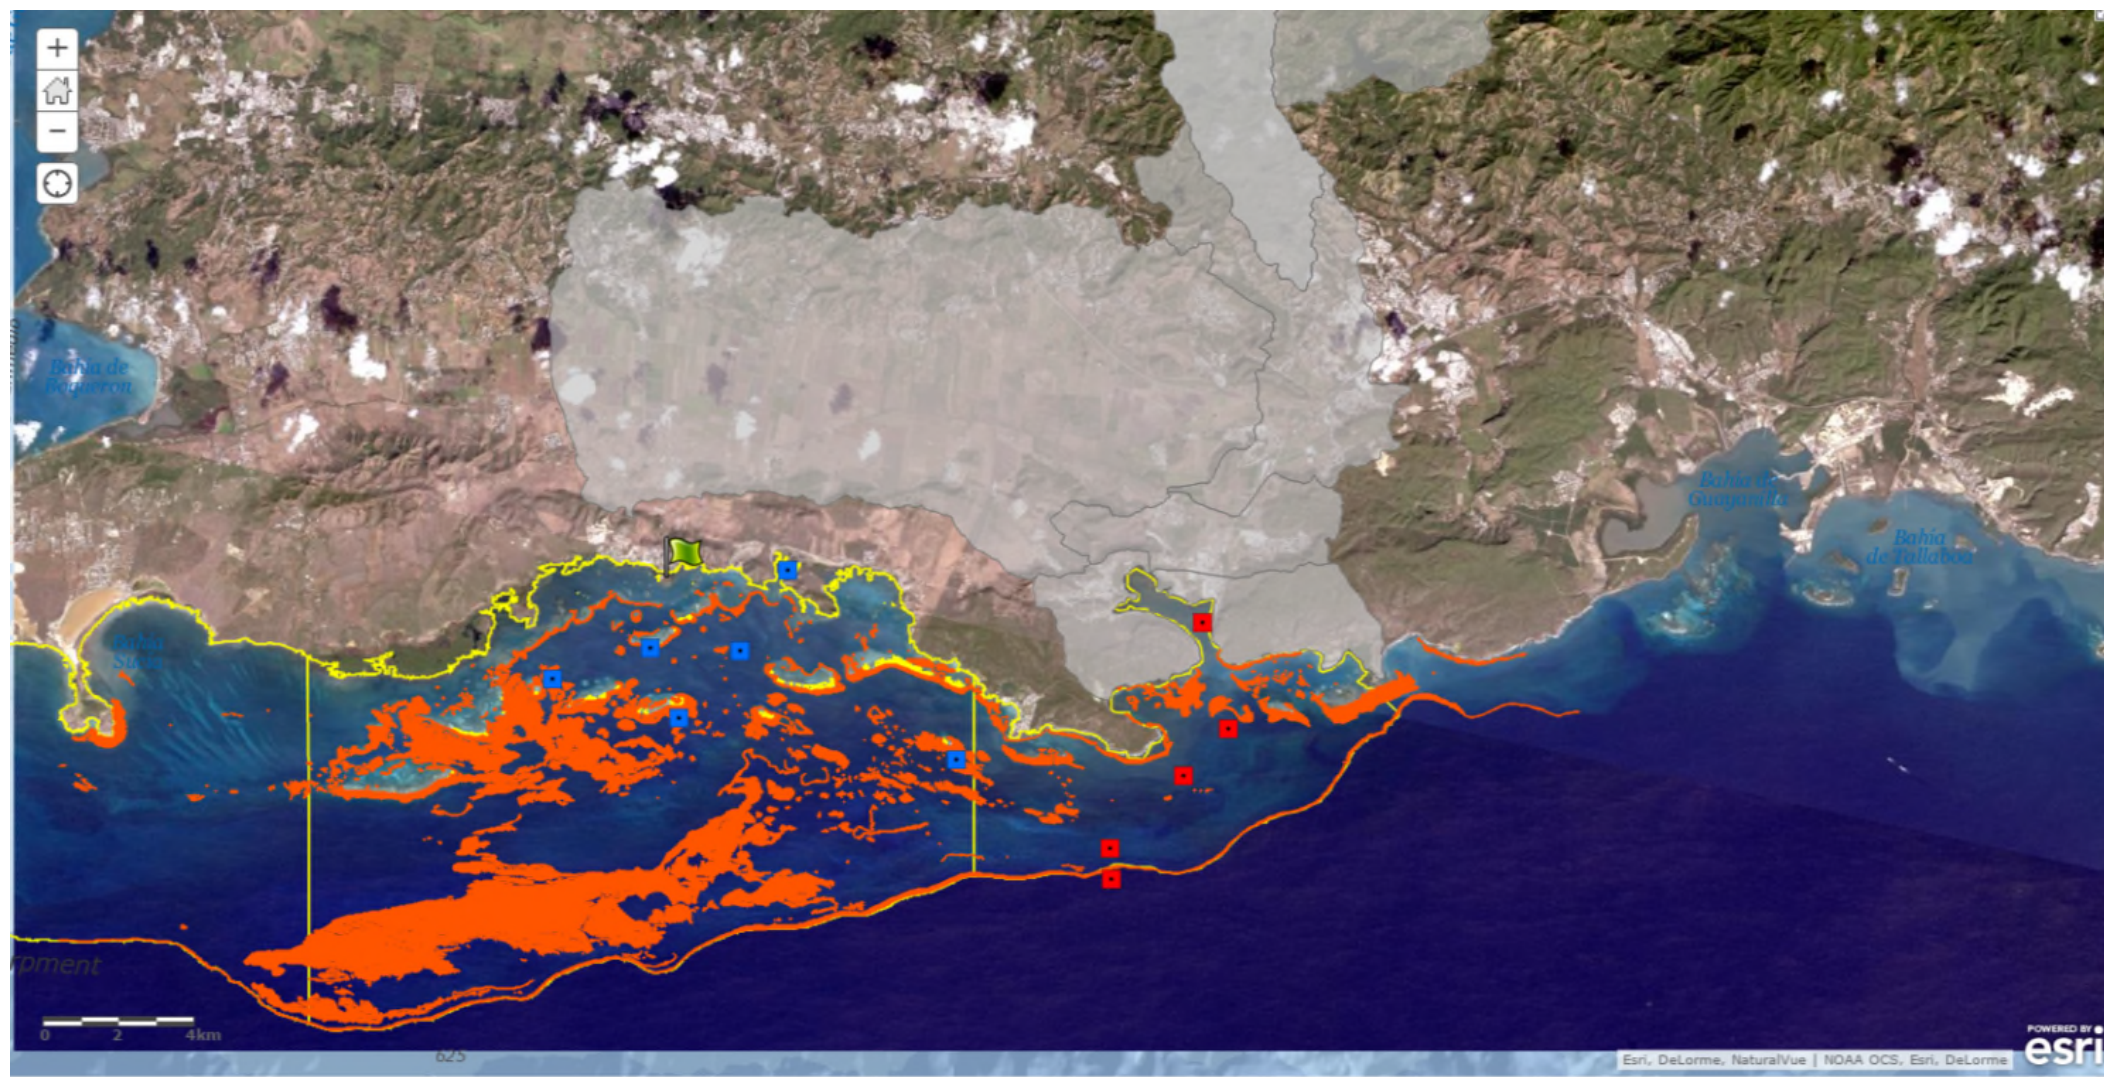

Matching large rainfall events to satellite derived measurements.

- Chlorophyll-*a* (Chl-*a*)
- Kd(490)

“Virtual Areas”

- Establishing virtual areas around watersheds will enable calculation of plume statistics such as:
 - Maximum and average levels of Chl-*a* and Kd(490)
 - Monthly climatologies
 - Variations from “normal” levels through time.
(Anomalies).

Study Area

Results

VIIRS Kd490 Time Series for PR-USVI Region, Guanica and Guanica/La Parguera

Results

10 km around Point A (17.92347 °N, 66.90108 °W)
Target Site: Guánica watershed discharge site, Puerto Rico

Results

VIIRS Kd490 Time Series for Guanica and Guanica/La Parguera and Precipitation data for Isla Magueyes

Field Sampling

- Simultaneous with Landsat 8 OLI image capture
- Instruments
 - **Satlantic Hyperpro Profiling radiometer (Lu, Ed, Rrs, Lw, Kd)**
 - GER 1500 Spectro-radiometer (Lw, Ed, Rrs)
 - SolarLight Datalogging Radiometer (PAR)
 - Hydroscat-6 (backscattering, fluorescence)
 - SCUFA (fluorescence, turbidity)
 - Water samples
 - CHL, TSS, CDOM

Hydroscat-6

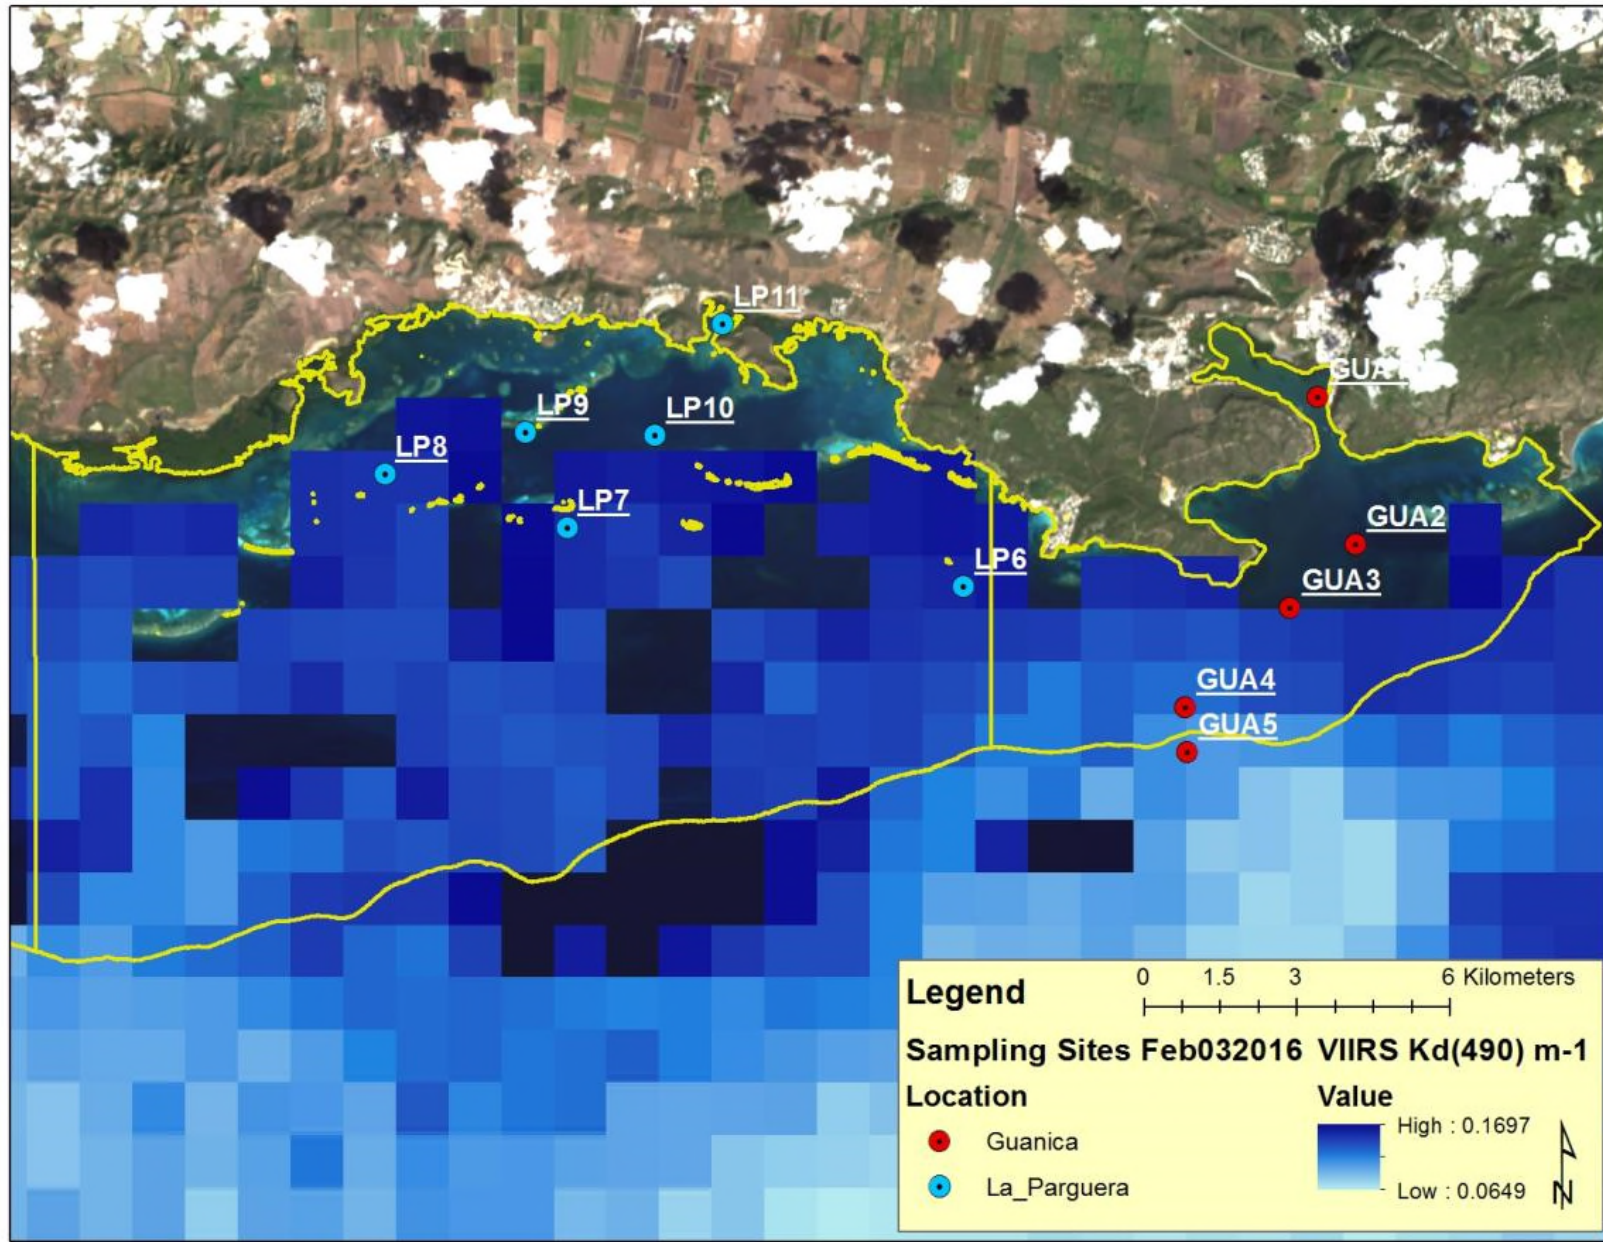

GER1500

SCUFA

Results (VIIRS-Field Sampling)

Results (Landsat 8)

Results- Field Sampling

Satlantic surface remote sensing reflectance

Results- Field Sampling

Kd (490) values for selected stations from VIIRS pixel value and Satlantic *in situ* sampling

Conclusions

- Provide *in situ* data for cal/val of satellite remote sensing data and improve local ocean color algorithms.
- Characterize the bio-optical properties of the waters.
- Provide watershed managers a long-term monitoring and near-real time data of water quality (CHL, TSS, CDOM) parameters.
- Develop additional satellite derived products using multi-resolution sensors and field data.
